DYNAMICS OF STRONGLY DAMPED WAVE EQUATIONS  
IN LOCALLY UNIFORM SPACES: ATTRACTORS  
AND ASYMPTOTIC REGULARITY

MEIHUA YANG AND CHUNYOU SUN

Abstract. This paper is dedicated to analyzing the dynamical behavior of strongly damped wave equations with critical nonlinearity in locally uniform spaces. After proving the global well-posedness, we first establish the asymptotic regularity of the solutions which appears to be optimal and the existence of a bounded (in $H^1_u(\mathbb{R}^N) \times H^1_u(\mathbb{R}^N)$) subset which attracts exponentially every initial $H^1_u(\mathbb{R}^N) \times L^2_u(\mathbb{R}^N)$-bounded set with respect to the $H^1_u(\mathbb{R}^N) \times L^2_u(\mathbb{R}^N)$-norm. Then, we show there is a $(H^1_u(\mathbb{R}^N) \times L^2_u(\mathbb{R}^N), H^1_\rho(\mathbb{R}^N) \times H^1_\rho(\mathbb{R}^N))$-global attractor, which reflects the strongly damped property of $\Delta u_t$ to some extent.

1. Introduction

It is well-known that in many cases the long-time behavior of dynamical systems generated by evolution equations of mathematical physics can be described naturally in terms of attractors of corresponding semigroups. In the case where the domain is bounded, the existence of the attractor has been established for a large class of equations; see [3, 9, 21, 24, 32]. However, in the case where the domain is unbounded, the situation becomes much more complicated, and we need to confer with more difficulties caused by the unboundedness of the spacial domain. In an unbounded domain typical Sobolev embeddings are not compact and the spaces $L^p(\mathbb{R}^N)$ are not nested, which makes our studies much more difficult. Moreover, the usual Sobolev spaces do not include the constant functions and the traveling waves. In order to include these special solutions (e.g., equilibria and relaxation waves) in the attractor, some authors consider bounded and uniformly continuous function spaces and weighted spaces; see [4, 18, 19, 22] and the references therein. Note that weighted spaces ignore the behavior of the solutions for large spatial values and for which the usual Sobolev type embeddings are not available. In [2, 8, 10, 12, 15, 16, 23, 25, 26, 31, 34] etc., the authors apply and develop the properties of locally uniform spaces which enjoy suitable nesting properties, have compact embeddings in weighted spaces and where constant functions lie in them. In these references, the authors study different nonlinear equations and properties...
of their nonlinear dynamics in locally uniform spaces, e.g., the authors in [2] systematically study the locally uniform spaces and present a rather complete linear theory of parabolic equations with initial data in locally uniform spaces.

In this paper, we consider the long time behavior of the following semilinear strongly damped wave equation in locally uniform spaces:

\begin{equation}
(1.1) \quad u_{tt} + \beta u_t - \alpha \Delta u_t - \Delta u + f(u) = g, \quad \text{in } \mathbb{R}^N \times \mathbb{R}^+,
\end{equation}

with initial data conditions

\begin{equation}
(1.2) \quad u(x, 0) = u_0(x), \quad u_t(x, 0) = v_0(x), \quad \text{in } \mathbb{R}^N,
\end{equation}

where \( \beta > 0, \alpha > 0 \) and \( g \in L^2_{\text{loc}}(\mathbb{R}^N) \) with \( N \geq 3 \). The nonlinear term \( f \) is a \( C^1 \)-function which satisfies the following conditions:

\begin{align}
(1.3) & \quad |f(s_1) - f(s_2)| \leq C|s_1 - s_2|(1 + |s_1|^q + |s_2|^q), \quad \forall \ s_1, s_2 \in \mathbb{R}, \\
(1.4) & \quad kF(s) + \mu s^2 - C_s \leq sf(s), \quad \forall \ s \in \mathbb{R}, \\
(1.5) & \quad \exists c_0 \in \mathbb{R}, \ -c_0 \leq F(s), \quad \forall \ s \in \mathbb{R},
\end{align}

where \( F(s) = \int_0^s f(r) dr \). These assumptions are the same as that in Cholewa and Dlotko [12].

Following [2] and [10, 12, 26, 34], we consider a strictly positive integrable weighted function \( \rho : \mathbb{R}^N \to (0, \infty) \): for \( 1 \leq p < \infty \), set (see [2, 8, 10, 12, 34] for more details)

\[ L^p_{\rho}(\mathbb{R}^N) = \left\{ \varphi \in L^p_{\text{loc}}(\mathbb{R}^N); \| \varphi \|_{L^p_{\rho}(\mathbb{R}^N)} = \left( \int_{\mathbb{R}^N} \rho(x)|\varphi(x)|^p dx \right)^{\frac{1}{p}} < \infty \right\}, \]

let \( \tau_y \rho(x) = \rho_y(x) = \rho(x - y), \ y \in \mathbb{R}^N \), and consider the locally uniform spaces

\begin{align}
L^p_{\text{loc}}(\mathbb{R}^N) = \{ \varphi \in L^p_{\text{loc}}(\mathbb{R}^N); \| \varphi \|_{L^p_{\text{loc}}(\mathbb{R}^N)} = \sup_{y \in \mathbb{R}^N} \| \varphi \|_{L^p_{\rho}(\mathbb{R}^N)} < \infty \}, \\
\hat{L}^p_{\text{loc}}(\mathbb{R}^N) = \{ \varphi \in L^p_{\text{loc}}(\mathbb{R}^N); \| \tau_y \varphi - \varphi \|_{L^p_{\rho}(\mathbb{R}^N)} \to 0 \text{ as } |y| \to 0 \},
\end{align}

where \( \hat{L}^p_{\text{loc}}(\mathbb{R}^N) \) is the closed subspace of \( L^p_{\text{loc}}(\mathbb{R}^N) \) consisting of all its elements that are translation continuous; see [2]. The locally uniform Sobolev spaces \( W^m_{\text{loc}}(\mathbb{R}^N) \) and \( W^{m, p}_{\text{loc}}(\mathbb{R}^N) \) are defined, respectively, by \( L^p_{\text{loc}}(\mathbb{R}^N) \) and \( \hat{L}^p_{\text{loc}}(\mathbb{R}^N) \) in a way similar to the standard \( W^m_p(\mathbb{R}^N) \).

We consider strictly positive integrable weighted functions \( \rho \in C^2(\mathbb{R}^N) \) satisfying

\begin{equation}
(1.6) \quad |\frac{\partial \rho}{\partial x_j}(x)| \leq \rho_j(x), \quad |\frac{\partial^2 \rho}{\partial x_j \partial x_k}(x)| \leq \rho_{jk}(x), \quad x \in \mathbb{R}^N, \ j, k = 1, \cdots, N,
\end{equation}
with certain positive constants $\rho_0, \rho_1$. As shown in [2, 3, 10, 12], arbitrary integrable strictly positive functions $\rho \in C^2(\mathbb{R}^N)$ satisfying \((1.6)\) will lead to the same locally uniform spaces $W_{\text{tu}}^{k,p}(\mathbb{R}^N)$, $k = 0, 1, 2$, $p \geq 1$, up to equivalent norms. Hence, in this paper, we consider the exemplary weighted functions

\begin{equation}
\rho(x) = (1 + \eta|x|^2)^{-1}, \quad \text{with } l > \frac{N}{2}, \eta > 0,
\end{equation}

where, obviously, one can obtain the estimates that $|\nabla \rho| \leq C\sqrt{\eta} \rho$ and $|\Delta \rho| \leq C \eta \rho$.

Problem \((1.1)-(1.2)\) has many relevant physical applications (e.g., see [28] for a summary), and its dynamics have been studied extensively by many authors; see [3, 6, 7, 13, 27, 28] and the reference therein. The existence and smoothness of the global attractor for the case where the spacial domain is bounded, e.g., see [5, 6, 7, 13, 27, 28] and the reference therein. The existence and smoothness of the global attractor for the case where the spacial domain is bounded, e.g., see [5, 6, 7, 13, 27, 28]. The existence of an 

\begin{equation}
(\mathcal{H}_1^1(\mathbb{R}^3) \times L^2(\mathbb{R}^3), H^1(\mathbb{R}^3) \times L^2(\mathbb{R}^3))\)-global attractor has been proved in Belleri and Pata [5], and further improved results are presented by Conti et al. in [13]. Furthermore, when the spacial domain is a bounded domain $\Omega$, for the system \((1.1)-(1.2)\) with homogeneous Dirichlet boundary conditions, the authors in [27] and [28] have proved that the corresponding 

\begin{equation*}
(\mathcal{H}_1^1(\Omega) \times L^2(\Omega), H^1(\Omega) \times L^2(\Omega))\)-global attractor $\mathcal{A}_H$ is in fact bounded in $H^2(\Omega) \times H_0^1(\Omega)$ for subcritical and critical cases respectively.

Under the framework of locally uniform spaces, the authors in [10, 10, 31, 34] have considered the weak dissipative wave equations, i.e., $\alpha = 0$ and $\beta > 0$.

About system \((1.1)-(1.2)\), more recently, under the assumptions of \((1.3)-(1.5)\), Cholewa and Dlotko [12] have obtained the global well-posedness results in the locally uniform spaces $W_{\text{tu}}^{2,p}(\mathbb{R}^N) \times L_{\text{tu}}^2(\mathbb{R}^N)$ with $p > \frac{N}{2}, p \geq 2$, and proved that their solutions generated a $C^0$ semigroup $\{S(t)\}_{t \geq 0}$ in this space. Furthermore, they also have considered the existence of the global attractor for $\{S(t)\}_{t \geq 0}$. They proved that $\{S(t)\}_{t \geq 0}$ has a bounded $(W_{\text{tu}}^{2,p}(\mathbb{R}^N) \times L_{\text{tu}}^2(\mathbb{R}^N), W_{\text{tu}}^{2,p}(\mathbb{R}^N) \times W_{\text{tu}}^{2,p}(\mathbb{R}^N))$-absorbing set, but for the attractor, they only obtained the $(W_{\text{tu}}^{2,p}(\mathbb{R}^N) \times L_{\text{tu}}^2(\mathbb{R}^N), W_{\text{tu}}^{1,p}(\mathbb{R}^N) \times W_{\text{tu}}^{1,p}(\mathbb{R}^N))$-global attractor for the subcritical case, i.e., $q < \frac{4}{N-2}$. The number $q = \frac{4}{N-2}$ is called a critical exponent since the nonlinearity $f$ is not compact in this case (i.e., for a bounded subset $B \subset \mathcal{H}_1^1(\mathbb{R}^N)$, in general, $f(B)$ is not precompact in $L_{\text{tu}}^{\frac{4}{N-2}}(\mathbb{R}^N)$).

This is an essential difficulty in studying the asymptotic behavior, even for the case that the spacial domain is bounded, e.g., see [2, 27, 28].

The main aim of this paper is to give a detailed analysis of the long-time behavior for the solutions of \((1.1)-(1.5)\) in locally uniform spaces $W_{\text{tu}}^{1,2}(\mathbb{R}^N) \times L_{\text{tu}}^2(\mathbb{R}^N)$, including the global well-posedness and asymptotic regularity of solutions, as well as some exponential attraction. Moreover, we try to show (or highlight) the strongly damped property of $\Delta u_t$. For example, we prove a slightly stronger attraction, the $(W_{\text{tu}}^{1,2}(\mathbb{R}^N) \times L_{\text{tu}}^2(\mathbb{R}^N), W_{\text{tu}}^{1,2}(\mathbb{R}^N) \times W_{\text{tu}}^{1,2}(\mathbb{R}^N))$-attractor. In other words, for the second ingredient $u_t(t)$ of the solution $(u(t), u_t(t))$, it should behave like the solution of a parabolic equation, which will reflect the strongly damped properties of $\Delta u_t$ to some extent.

This paper is organized as follows.

In section 2, we first recall some function spaces and list some short notation which will be used throughout this paper; then we summarize some technical propositions which are useful for our latter proofs and may also be interesting to other people who work in locally uniform spaces.
In sections 3-5, we consider the global well-posedness of problem (1.1)-(1.2) in $W^{1,2}_{lu}(\mathbb{R}^N) \times L^2_{lu}(\mathbb{R}^N)$. Using the methods/framework of [11, 12], and combining some techniques in [31, 34] which are used to obtain some continuities, we define the global weak solutions (see Definition 5.1) by approximations, which generate a continuous semigroup in $W^{1,2}_{lu}(\mathbb{R}^N) \times L^2_{lu}(\mathbb{R}^N)$; see Theorems 5.2 and 5.3

Then, after some preliminary a priori estimates given in sections 6-8, by using the methods in [33] we overcome the difficulty caused by the critical nonlinearity, and prove the following asymptotic regularity result in section 9, which appears to be optimal:

**Theorem 1.1** (Asymptotic regularity). Let $f$ satisfy (1.3)-(1.5), $g \in L^2_{lu}(\mathbb{R}^N)$, and $\{S(t)\}_{t \geq 0}$ be the semigroup generated by the global weak solutions of (1.1)-(1.2) with the initial data $(u_0, v_0) \in W^{1,2}_{lu}(\mathbb{R}^N) \times L^2_{lu}(\mathbb{R}^N)$. Then, there exist a set $B_1 \subset W^{2,2}_{lu}(\mathbb{R}^N) \times W^{1,2}_{lu}(\mathbb{R}^N)$ (closed and bounded in $W^{2,2}_{lu} \times W^{1,2}_{lu}$), a positive constant $\nu$ and a monotonically increasing function $Q(\cdot)$ such that: for any bounded subset $B \subset W^{1,2}_{lu}(\mathbb{R}^N) \times L^2_{lu}(\mathbb{R}^N)$, the following estimate holds:

$$\text{dist}_{W^{1,2}_{lu} \times L^2_{lu}}(S(t)B, B_1) \leq Q(\|B\|_{W^{1,2}_{lu} \times L^2_{lu}}) e^{-\nu t},$$

where $\text{dist}_{W^{1,2}_{lu} \times L^2_{lu}}$ denotes the usual Hausdorff semidistance in $W^{1,2}_{lu}(\mathbb{R}^N) \times L^2_{lu}(\mathbb{R}^N)$.

This theorem says that asymptotically, the solutions are exponentially close or approach more regular solutions in a slightly stronger norm: the $W^{1,2}_{lu} \times L^2_{lu}$-norm instead of $W^{1,2}_{lu} \times L^2_{lu}$-norm, although the global attractor $\mathcal{A}$ obtained in Theorem 1.2 below attracts them only in a weighted space topology.

It is worth noting that Theorem 1.1 is also interesting in the bounded domain case (e.g., see [27, 29, 30]), and to the authors’ knowledge, this is the first regularity result in locally uniform space for the wave-type equations with critical nonlinearity. Moreover, it is also a basis for further considering the asymptotic behavior. For example, based on this result, we are constructing an infinite-dimensional exponential attractor for (1.1) (see [14] for the corresponding results of parabolic equations): simultaneously, combining some continuity with respect to the $W^{1,2}_{lu}(\mathbb{R}^N) \times W^{1,2}_{lu}(\mathbb{R}^N)$-topology, we have the following existence result about the attractor:

**Theorem 1.2** (Global attractors). Assume $f$ satisfies (1.3)-(1.5) and $g \in L^2_{lu}(\mathbb{R}^N)$. Then the semigroup $\{S(t)\}_{t \geq 0}$ generated by the global weak solutions of (1.1)-(1.2) with the initial data $(u_0, v_0) \in W^{1,2}_{lu}(\mathbb{R}^N) \times L^2_{lu}(\mathbb{R}^N)$ has a unique $(W^{1,2}_{lu}(\mathbb{R}^N) \times L^2_{lu}(\mathbb{R}^N), W^{1,2}_{\rho}(\mathbb{R}^N) \times W^{1,2}_{\rho}(\mathbb{R}^N))$-global attractor $\mathcal{A}$, which satisfies

(i) $\mathcal{A}$ is compact in $W^{1,2}_{\rho}(\mathbb{R}^N) \times W^{1,2}_{\rho}(\mathbb{R}^N)$ and attracts every bounded subset of $W^{1,2}_{lu}(\mathbb{R}^N) \times L^2_{lu}(\mathbb{R}^N)$ with respect to the $W^{1,2}_{\rho}(\mathbb{R}^N) \times W^{1,2}_{\rho}(\mathbb{R}^N)$-norm;

(ii) $\mathcal{A}$ is closed and bounded in $W^{2,2}_{lu}(\mathbb{R}^N) \times W^{1,2}_{lu}(\mathbb{R}^N)$;

(iii) $\mathcal{A}$ is invariant; that is, $S(t)\mathcal{A} = \mathcal{A}$ for any $t \geq 0$.

For convenience, hereafter let $\|\cdot\|_{W^{m,p}_{lu}}$, $\|\cdot\|_{W^{m,p}_{\rho}}$, $\|\cdot\|_{W^{m,p}_{\phi}}$, and $\|\cdot\|_{W^{m,p}}$ be the norms of $W^{m,p}_{lu}(\mathbb{R}^N)$, $W^{m,p}_{lu}(\mathbb{R}^N)$, $W^{m,p}_{\rho}(\mathbb{R}^N)$ and $W^{m,p}(\mathbb{R}^N)$, respectively. Also, let $\langle \cdot, \cdot \rangle$ be the usual inner product in $L^2(\mathbb{R}^N)$ and let $C$ be an arbitrary positive constant, which may be different from line to line or even in the same line.
Here and later on we omit the domain $\mathbb{R}^N$ when the function space is defined over $\mathbb{R}^N$, e.g., write $W_{tu}^{m,p}(\mathbb{R}^N)$ as $W_{tu}^{m,p}$; otherwise we will specifically point it out.

### 2. Preliminaries

First, we recall the uniform space $W^{s,p}_U(\mathbb{R}^N)$, $s \in \mathbb{R}^+ \cup \{0\}$ (see [2, 15, 16, 26]), the Banach space consisting of all $\phi \in W^{s,p}_{loc}(\mathbb{R}^N)$ such that

$$\|\phi\|_{W^{s,p}_U(\mathbb{R}^N)} = \sup_{y \in \mathbb{R}^N} \|\phi\|_{W^{s,p}(B(y,1))} < \infty,$$

where $B(y, 1) = \{x \in \mathbb{R}^N \mid |x - y| \leq 1\}$.

From [2], we know that, for the weighted function $\rho$ satisfying (1.6) in $L^p_{tu}$, the following two norms are equivalent: there exist $C_1, C_2$ such that for all $u \in L^p_{tu}$,

$$\|u\|_{L^p_{tu}} \sup_{y \in \mathbb{R}^N} \int_{\mathbb{R}^N} \rho(x-y)|u(x)|^p \, dx \leq C_1 \sup_{y \in \mathbb{R}^N} \int_{B(y,1)} |u(x)|^p \, dx \leq C_2 \|u\|_{L^p_{tu}}.$$

Notice that inequality (2.1) implies that for $k \in \mathbb{N} \cup \{0\}$, uniform space $W^{k,p}_U$ and locally uniform space $W^{k,p}_{tu}$ coincide algebraically and topologically when the weighted function $\rho$ satisfies (1.6). Furthermore, by intermediate spaces we know that the same holds for $W^{s,p}_U$ and $W^{s,p}_{tu}$ with $s \in \mathbb{R}^+ \cup \{0\}$ (see Proposition 4.1 of [2]), and we will use this equivalence frequently in our paper.

**Notation.** For $s \in \mathbb{R}$, we denote $H^s_U = W^{s,2}_U$ and

$$\mathcal{H}_s = H^{s+1}_U \times H^s_U = W^{(s+1),2}_U \times W^{s,2}_U$$

with the norm

$$\|(u, v)\|_{\mathcal{H}_s}^2 = \|u\|_{W^{(s+1),2}_U}^2 + \|v\|_{W^{s,2}_U}^2.$$

Then, in particular,

$$\mathcal{H}_0 = W^{1,2}_U \times L^2_U = H^1_U \times L^2_U = H^{1}_{1u} \times L^2_{tu},$$

$$\mathcal{H}_1 = W^{2,2}_U \times W^{1,2}_U = H^2_U \times H^1_U = H^{2}_{1u} \times H^1_{tu}.$$

For the latter applications, we next recall some properties of locally uniform spaces.

**Lemma 2.1 ([2]).** (i) If $s_1 \geq s_2 \geq 0$, $1 < p_1 \leq p_2 < \infty$ and $s_1 - \frac{N}{p_1} \geq s_2 - \frac{N}{p_2}$, then

$$W^{s_1,p_1}_{tu}(\mathbb{R}^N) \hookrightarrow W^{s_2,p_2}_{tu}(\mathbb{R}^N)$$

is continuous. Moreover,

$$\|\phi\|_{W^{s,p}_U} \leq C\|\phi\|_{W^{s_1,p_1}_{tu}}^{\theta} \|\phi\|_{W^{s_2,p_2}_{tu}}^{1-\theta},$$

where $\theta \in [0, 1]$, $\frac{1}{p} = \frac{\theta}{p_1} + \frac{1-\theta}{p_2}$, $1 < p, p_1, p_2 < \infty$ and

$$s - \frac{N}{p} \leq \theta \left(s_1 - \frac{N}{p_1}\right) + (1-\theta) \left(s_2 - \frac{N}{p_2}\right).$$
Proposition 2.3. There exist positive constants $C_1, C_2$ such that

\[ C_1 \phi \| \phi \|^2_{W^{2\alpha, 2}} \leq \| \phi \|_{L^p}^2 + \| (-\Delta)^\alpha \phi \|^2_{L^2} \leq C_2 \alpha \| \phi \|^2_{W^{2\alpha, 2}} \]

for all $\phi \in W^{2\alpha, 2}$.

Lemma 2.2 (2). Let $\alpha \in [0, 1]$. Then there exist positive constants $C_{1, \alpha}$ and $C_{2, \alpha}$ such that

\[ C_{1, \alpha} \| \phi \|^2_{W^{2\alpha, 2}} \leq \| \phi \|^2_{L^p} + \| (-\Delta)^\alpha \phi \|^2_{L^2} \leq C_{2, \alpha} \| \phi \|^2_{W^{2\alpha, 2}} \]

for all $\phi \in W^{2\alpha, 2}$.

This lemma provides the theoretical feasibility for us to use fractional power operators, consequently, the bootstrap methods; see §7 - §8.

On the other hand, from the definition of $\rho$ (in (1.4)), obviously, we have

Proposition 2.3. There exist $C_1, C_2$ such that

\[ C_1 \rho(x) \leq \inf_{y \in B(x, 1)} \rho(y) \leq \sup_{y \in B(x, 1)} \rho(y) \leq C_2 \rho(x) \quad \text{for all } x \in \mathbb{R}^N, \]

where $B(x, 1) = \{ y \in \mathbb{R}^N \mid |y - x| \leq 1 \}$.

Then, similar to Proposition 1.2 of [34], we have the following property

Proposition 2.4. There exist $C_1, C_2$ such that for all $u \in L^p_\theta (1 \leq p < \infty)$,

\[ C_1 \int_{\mathbb{R}^N} \rho(x) |u(x)|^p dx \leq \int_{\mathbb{R}^N} \rho(y) \int_{B(y, 1)} |u(x)|^p dx dy \leq C_2 \int_{\mathbb{R}^N} \rho(x) |u(x)|^p dx. \]

Combining Proposition 2.4 with the interpolation inequality for bounded domain, we can get the following interpolation inequalities in weighted spaces and locally uniform spaces:

Proposition 2.5. For any $p \in [2, \frac{2N}{N-2}]$ and $\theta \in [0, 1]$, we have

\[ \| \varphi \|_{L^p_\theta} \leq C \| \varphi \|_{L^p_0}^{\frac{1-\theta}{2}} \| \varphi \|_{L^p_0}^{\frac{1-\theta}{2}} \]

where $\frac{1}{p} = \frac{1}{p_1} + \frac{1}{p_2}$ and $-\frac{N}{p_1} \leq \theta(1 - \frac{N}{p_2}) - (1 - \theta) \frac{N}{p_2}$.

Proof. We only give a proof for the first inequality; the second can be obtained by the same method:

\[ \int_{\mathbb{R}^N} \rho(x) |\varphi(x)|^p dx \leq C \int_{\mathbb{R}^N} \rho(y) \int_{B(y, 1)} |\varphi(x)|^p dx dy \]

\[ \leq C \int_{\mathbb{R}^N} \rho(y) \| \varphi \|_{L^p(B(y, 1))}^{\frac{1-\theta}{2}} \| \varphi \|_{L^p(B(y, 1))}^{\frac{1-\theta}{2}} dy \]

\[ \leq C \sup_{y \in \mathbb{R}^N} \| \varphi \|_{L^p(B(y, 1))} \int_{\mathbb{R}^N} \rho(y) \| \varphi \|_{L^p(B(y, 1))}^{(1-\theta)} dy \]

\[ \leq C \| \varphi \|_{L^p_0} \left( \int_{\mathbb{R}^N} \rho(y) \| \varphi \|_{L^p(B(y, 1))} dy \right)^{\frac{1-\theta}{2}} \left( \int_{\mathbb{R}^N} \rho(y) dy \right)^{\frac{1-\theta}{2}} \]

\[ \leq C \| \varphi \|_{L^p_0} \| \varphi \|_{L^p_0}^{(1-\theta)}. \]

Next we give a density lemma, which will be used to define the weak solution.
Lemma 2.6. Let \( ρ(\cdot) \) satisfy (1.6). Then \( \dot{H}^1_{1u} \) is a dense set of \( H^1_{1u} \) w.r.t. the \( H^1_{\rho} \)-norm. Moreover, for each \( v \in H^1_{1u} \), there is a bounded (in \( H^1_{1u} \)) sequence \( \{v_n\}_{n=1}^\infty \subset \dot{H}^1_{1u} \) that satisfies \( v_n \to v \) w.r.t. the \( H^1_{\rho} \)-norm.

Proof. Let \( θ \in C^∞ \) be a cutoff function: \( θ(s) : [0, \infty) \to [0, 1] \),

\[
θ(s) = 1 \text{ for } 0 \leq s \leq 1, \quad θ(s) = 0 \text{ for } s \geq 2,
\]

and \( |θ'(s)| \leq C_1 \) for all \( s \in [0, \infty) \).

For any \( ε > 0 \) and each \( v \in H^1_{1u} \), we know that there exists a positive constant \( R = R(ε, ρ, ||v||_{H^1_{1u}}, C_1) \) such that

\[
||v||_{H^1_2(\mathbb{R}^N \setminus B(0, R))} \leq \frac{ε}{2C_1}.
\]

Let \( θ_R(x) = θ(\frac{|x|^2}{4ε}) \). Then, obviously,

\[
θ_Rv \in H^1_0(B(0, 2R)) \subset \dot{H}^1_{1u} \quad \text{and} \quad ||θ_Rv||^2_{H^1_{1u}} \leq (1 + C_1)||v||^2_{H^1_{1u}}.
\]

Moreover,

\[
||θ_R(x)v(x) - v(x)||^2_{H^1_2} \leq \int_{\mathbb{R}^N \setminus B(0, R)} ρ(x)(1 - θ_R(x))v(x)^2 + ρ(x)||∇((1 - θ_R(x))v(x))|^2dx
\]

\[
\leq \int_{\mathbb{R}^N \setminus B(0, R)} ρ(x)||v(x)||^2 + ||∇v(x)||^2dx + Cθ_R∫_{\mathbb{R}^N \setminus B(0, R)} ρ(x)||v(x)||^2dx
\]

\[
\leq ε.
\]

Hence, the conclusion of Lemma 2.6 holds.

Remark 2.7. In fact, let \( m, p \in \mathbb{N} \cup \{0\} \) and \( ρ(\cdot) \) satisfy (1.6); then \( W^{m,p}_{1u} \) is dense in \( W^m_{\rho} \) w.r.t. the \( W^m_{\rho} \)-norm. Moreover, for each \( v \in W^m_{1u} \), there is a bounded (in \( W^m_{1u} \)) sequence \( \{v_n\}_{n=1}^\infty \subset W^m_{\rho} \) that satisfies \( v_n \to v \) w.r.t. the \( W^m_{\rho} \)-norm.

3. THE SEMIGROUP GENERATED BY (1.1)-(1.2)

In this section, we will consider the well-posedness of system (1.1)-(1.2). To this end, we will use the methods/framework as in [11, 12]. In our study, the space \( W^2_{1u} \times L^p_{1u} \) is necessary, where our elliptic operator will enjoy a dense domain. That is, it will generate a strong continuous analytic semigroup.

At first, note that we can rewrite (1.1) as an abstract parabolic equation

\[
\frac{d}{dt} \left( \begin{array}{c}
u \\
u
\end{array} \right) + \left( \begin{array}{cc}0 & -I \\ -Δ & βI - αΔ
\end{array} \right) \left( \begin{array}{c}
u \\
u
\end{array} \right) = \left( \begin{array}{c}0 \\
f(u) + g
\end{array} \right), \quad t > 0,
\]

with initial data

\[
\left( \begin{array}{c}
u \\
u
\end{array} \right)_{t=0} = \left( \begin{array}{c}u_0 \\
v_0
\end{array} \right).
\]

From Cholewa and Dlotko [12] we have the following results:

Lemma 3.1 ([12]). For each \( α > 0 \), the strongly damped wave operator

\[
Π = \left( \begin{array}{cc}0 & -I \\ -Δ & βI - αΔ
\end{array} \right)
\]

License or copyright restrictions may apply to redistribution; see http://www.ams.org/journal-terms-of-use
with the domain

\[ D(\Pi) = \dot{W}^{2,p}_{tu}(\mathbb{R}^N) \times \dot{W}^{2,p}_{tu}(\mathbb{R}^N) \]

is a sectorial operator in \( \dot{W}^{2,p}_{tu}(\mathbb{R}^N) \times L_p^p(\mathbb{R}^N) \) for each \( p \in (1, \infty) \).

Based on the general result above, we now prove the following global solvability of (1.1)-(1.2). For convenience, without loss of generality we always assume \( \alpha = \beta = 1 \) hereafter.

**Theorem 3.2.** Assume that \( f \) satisfies (1.4)-(1.5) and \( g \in \dot{L}^2_{tu} \). Then the problem (1.1)-(1.2) defines in \( Y = \dot{W}^{2,2}_{tu} \times \dot{L}^2_{tu} \) a \( C^0 \)-semigroup \( \{\tilde{S}(t)\}_{t \geq 0} \) of global solutions; that is, for each \((u_0, v_0) \in Y\) and any \( T > 0 \) there exists a unique solution

\[ (u, u_t) \in C([0, T], Y) \cap C^1((0, T), Y) \cap C((0, T), \dot{W}^{2,2}_{tu} \times \dot{W}^{2,2}_{tu}), \]

depending continuously upon the initial condition.

**Proof.** We will complete the proof by two steps.

**Step 1. Local well-posedness.** This problem can be seen as an abstract semilinear parabolic problem, in \( Y \), having the form (3.1)-(3.2). From the standard semigroup theory about local well-posedness (e.g., see [9]) of an abstract parabolic equation, thanks to Lemma 3.1 above, we only need to verify that \((0, f(\cdot) + g)^T\) is local Lipschitz in \( Y \), which is equivalent to \( f(\cdot) \), is local Lipschitz from \( \dot{W}^{2,2}_{tu} \) to \( \dot{L}^2_{tu} \) and will be obtained as follows: For any \( u_1, u_2 \in \dot{W}^{2,2}_{tu} \) and any \( y \in \mathbb{R}^N \), we have

\[
\begin{align*}
&\int_{\mathbb{R}^N} \rho_y(x) |f(u_1) - f(u_2)|^2 \, dx \\
&\leq C \int_{\mathbb{R}^N} \rho_y(x) \left( 1 + |u_1|^{\frac{2}{\alpha}} + |u_2|^{\frac{2}{\alpha}} \right)^2 |u_1 - u_2|^2 \, dx \\
&\leq C \int_{\mathbb{R}^N} \rho_y(z) \int_{B(z, 1)} \left( 1 + |u_1|^{\frac{2}{\alpha}} + |u_2|^{\frac{2}{\alpha}} \right)^2 |u_1 - u_2|^2 \, dx \, dz \\
&\leq C' \int_{\mathbb{R}^N} \rho_y(z) \int_{B(z, 1)} |u_1 - u_2|^{\frac{2N}{\alpha}} \, dx \, dz \\
&\leq C' \int_{\mathbb{R}^N} \rho_y(z) |u_1 - u_2|^{\frac{2}{2}} |u_1 - u_2|^{2} \, dz \\
&\leq C' \int_{\mathbb{R}^N} \rho_y(|\Delta(u_1 - u_2)|^2 + |\nabla(u_1 - u_2)|^2 + |u_1 - u_2|^2) \, dx.
\end{align*}
\]

(3.3)

Here we used Proposition 2.4 and the growth condition (1.3), and the constant \( C' \) here only depends on the constants in Proposition 2.4 and the bounds of \( ||u_i||_{\dot{W}^{2,2}_{tu}} \) \( (i = 1, 2) \).

Thus, the application of a standard perturbation result [9] leads to a local solution to (3.1)-(3.2). That is, there exists \( \tau > 0 \) and a unique \( Y \)-valued function continuous on \([0, \tau]\) such that the equation

\[
\begin{pmatrix}
    u(t) \\
    v(t)
\end{pmatrix}
= e^{-\Pi t} \begin{pmatrix}
    u_0 \\
    v_0
\end{pmatrix}
+ \int_0^t e^{-\Pi(t-s)} \begin{pmatrix}
    u(s) \\
    v(s)
\end{pmatrix} \, ds
\]

is satisfied for $t \in [0, \tau]$. Furthermore, the solution to (3.1)-(3.2) is defined for all $t \geq 0$ unless its $Y$-norm blows up in a finite time.

Step 2. Global existence. To obtain the global existence of solution in $Y$, we need to show its $Y$-norm do not blow up in a finite time.

At first, by the a priori estimates given in Theorem 4.1 (e.g., (4.16)), we know that for each local solution $(u(t), u_1(t))$ corresponding to initial data $(u_0, v_0) \in Y$, its $H^1_{2u} \times L^2_{1u}$-norm cannot blow up at a finite time.

Then, we only need to show as follows that $\|u(t)\|_{H^2_{2u}}$ cannot blow up in a finite time.

Multiplying (1.1) by $-\rho_y \Delta u$, we have

$$\frac{d}{dt} \left( \frac{1}{2} \int_{\mathbb{R}^N} \rho_y |\Delta u|^2 - \int_{\mathbb{R}^N} \rho_y u_t \Delta u \right) + \int_{\mathbb{R}^N} \rho_y |\Delta u|^2 - \int_{\mathbb{R}^N} \rho_y u_t \Delta u - \int_{\mathbb{R}^N} \rho_y |\nabla u_t|^2$$

$$= \int_{\mathbb{R}^N} \rho_y f'(u) |\nabla u|^2 + \int_{\mathbb{R}^N} \rho_y f(u) \nabla u + \int_{\mathbb{R}^N} \rho_y g \Delta u + \int_{\mathbb{R}^N} \rho_y u_t \nabla u_t,$$

where, similar to (3.3) (or see (4.27) and (4.28)), we have

$$\left| \int_{\mathbb{R}^N} \rho_y f'(u) |\nabla u|^2 \right| \leq C_{\|u\|_{H^1_{2u}}} \int_{\mathbb{R}^N} \rho_y (|\Delta u|^2 + |u|^2),$$

$$\left| \int_{\mathbb{R}^N} \rho_y f(u) \nabla u \right| \leq C_{\|u\|_{H^1_{2u}}} + \frac{1}{4} \int_{\mathbb{R}^N} \rho_y (|\Delta u|^2 + |u|^2).$$

At the same time,

$$\left| \int_{\mathbb{R}^N} \rho_y g \Delta u \right| \leq \int_{\mathbb{R}^N} \rho_y |g|^2 + \frac{1}{4} \int_{\mathbb{R}^N} \rho_y |\Delta u|^2,$$

$$\left| \int_{\mathbb{R}^N} \rho_y u_t \nabla u_t \right| \leq \int_{\mathbb{R}^N} \rho_y |u_t|^2 + \int_{\mathbb{R}^N} \rho_y |\nabla u_t|^2.$$

Therefore, we have

$$\frac{d}{dt} E(t) \leq C_1 E(t) + 2 \int_{\mathbb{R}^N} \rho_y |\nabla u_t|^2 + C_2,$$

where $E(t) = \frac{1}{2} \int_{\mathbb{R}^N} \rho_y |\Delta u(t)|^2 - \int_{\mathbb{R}^N} \rho_y u_t(t) \Delta u(t)$, $C_1$ depends only on $\|u(t)\|_{H^1_{2u}}$, and $C_2$ depends only on $\|g\|_{L^2_{t,\infty}}, \|u_t(t)\|_{L^2_{t,\infty}}, \|u(t)\|_{H^1_{2u}}$. Then from (4.7), we know that $C_1, C_2$ depend only on $(u_0, v_0)$, $g$ and the coefficients in (1.3)-(1.5).

Hence, applying the Gronwall lemma, we have

$$E(t) \leq e^{C_1 t} E(0) + \frac{C_2}{C_1} e^{C_1 t} + 2 e^{C_1 t} \int_0^t \int_{\mathbb{R}^N} \rho_y |\nabla u_t(s)|^2 dx ds.$$

For the last term on the right hand side, integrating (4.5) over $[0, t]$ and using (1.5), we know this term can also be dominated only by $(u_0, v_0)$, $g$ and the constant $c_0$ in (1.5).

So, by using the Cauchy inequality to (3.4) we get that $\|\Delta u(t)\|_{L^2_{t,\infty}}$ cannot blow up at a finite time, which implies the global existence of solutions.

Remark 3.3. From the proof above, we observe (from (3.3)) that if only for the local well-posedness in $Y$, we can enlarge the growth order $\frac{4}{N-2}$ in (1.3) to $\frac{4}{N-4}$.
More generally, for a general phase space $\dot{W}^{2,p}_{1u} \times \dot{L}^{p}_{u}$, $p \geq 2$ (considered in [12]), if $f$ satisfies the following condition, instead of (1.3),

$$ (3.5) \quad |f(s_1) - f(s_2)| \leq C_0|s_1 - s_2|\left(1 + |s_1|^{\frac{2p}{p-2}} + |s_2|^{\frac{2p}{p-2}}\right) \quad \forall \ s_1, s_2 \in \mathbb{R}, $$

then using the same methods as (3.3), we can deduce the following local Lipschitz continuity:

$$ (3.6) \quad \int_{\mathbb{R}^N} \rho(y)|f(u_1) - f(u_2)|^p dy \leq C_{\|u_1\|_{\dot{W}^{2,p}_{1u}}, \|u_2\|_{\dot{W}^{2,p}_{1u}}, c_0} \|u_1 - u_2\|_{\dot{W}^{2,p}_{1u}}^p, $$

which, combined with Lemma 3.1, immediately implies the local well-posedness results in $\dot{W}^{2,p}_{1u} \times \dot{L}^{p}_{u}$.

Remark 3.4. Note that in Theorem 3.2 and Remark 3.3, we do not assume that $p$ satisfies the additional assumption $p > \frac{N}{2}$ as required in [12] (to our knowledge, the assumption $p > \frac{N}{2}$ in [12] is mainly for obtaining the embedding $\dot{W}^{2,p}_{1u}(\mathbb{R}^N) \hookrightarrow L^{\infty}(\mathbb{R}^N)$, which is then used to guarantee the Lipschitz continuity of $f$).

4. A priori estimates for the solutions given in Theorem 3.2

4.1. Dissipation estimates in $\mathcal{H}_0$.

**Theorem 4.1.** Under the assumptions of Theorem 3.2, there is a positive constant $\varrho_0$ such that for any bounded (in $\mathcal{H}_0$) subset $B \subset \dot{W}^{2,2}_{1u} \times \dot{L}^{2}_{u}$, there exists a positive constant $T_1 = T_1(B)$ which depends only on the $\mathcal{H}_0$-bound of $B$ such that

$$ \|u(t)\|_{\dot{H}^{1}_{1u}} + \|u(t)\|_{\dot{L}^{2}_{u}} \leq \varrho_0 \quad \text{for all} \ t \geq T_1 \text{ and } (u_0, v_0) \in B. $$

**Proof.** Multiplying (1.1) by $\rho\eta(u + \frac{1}{2}u)$, we have

$$ (u_t + \frac{1}{2}u_t, \rho\eta(u + \frac{1}{2}u) + \frac{1}{2}(u_t, \rho\eta(u + \frac{1}{2}u)) - \langle \Delta u_t, \rho\eta(u + \frac{1}{2}u) \rangle - \langle \Delta u_t, \rho\eta(u + \frac{1}{2}u) \rangle $$

$$ (4.1) \quad -\langle \Delta u, \rho\eta(u + \frac{1}{2}u) \rangle + \langle f, \rho\eta(u + \frac{1}{2}u) \rangle = \langle g, \rho\eta(u + \frac{1}{2}u) \rangle. $$

Next, we deal with each term of (4.1) one by one as follows:

$$ \langle (u_t + \frac{1}{2}u_t)\rho\eta(u + \frac{1}{2}u) \rangle = \int_{\mathbb{R}^N} d \int_{\mathbb{R}^N} \rho(y)|u_t + \frac{1}{2}u|^2, $$

$$ \langle \frac{1}{2}u_t, \rho\eta(u + \frac{1}{2}u) \rangle = \frac{1}{2} \int_{\mathbb{R}^N} \rho(y)|u_t|^2 + \frac{1}{8} \int_{\mathbb{R}^N} \rho(y)|u|^2, $$

$$ \langle -\Delta u_t, \rho\eta(u + \frac{1}{2}u) \rangle $$

$$ = \int_{\mathbb{R}^N} \rho(y)|\nabla u_t|^2 + \frac{1}{4} \int_{\mathbb{R}^N} \rho(y)|\nabla u|^2 + \int_{\mathbb{R}^N} \nabla u_t \nabla \rho\eta u_t + \frac{1}{2} \int_{\mathbb{R}^N} \nabla u_t \nabla \rho\eta u $$

and

$$ \langle -\Delta u, \rho\eta(u + \frac{1}{2}u) \rangle $$

$$ = \frac{1}{2} \int_{\mathbb{R}^N} \rho(y)|\nabla u|^2 + \frac{1}{2} \int_{\mathbb{R}^N} \rho(y)|\nabla u|^2 + \int_{\mathbb{R}^N} \nabla u \nabla \rho\eta u_t + \frac{1}{2} \int_{\mathbb{R}^N} \nabla u \nabla \rho\eta u, $$

where

$$ \int_{\mathbb{R}^N} \nabla u_t \nabla \rho\eta u_t + \frac{1}{2} \int_{\mathbb{R}^N} \nabla u_t \nabla \rho\eta u \leq C \sqrt{\eta} \int_{\mathbb{R}^N} \rho(y)(|\nabla u_t|^2 + |u_t|^2 + |u|^2). $$
and

\[ \left| \int_{\mathbb{R}^N} \nabla u \nabla \rho_y u_t + \frac{1}{2} \int_{\mathbb{R}^N} \nabla u \nabla \rho_y u \right| \leq C \sqrt{\eta} \int_{\mathbb{R}^N} \rho_y (|\nabla u|^2 + |u_t|^2 + |u|^2). \]

On the other hand,

\[ \langle f(u), \rho_y (u_t + \frac{1}{2} u) \rangle = \frac{d}{dt} \int_{\mathbb{R}^N} \rho_y F(u) + \frac{1}{2} \int_{\mathbb{R}^N} \rho_y f(u) u \]

and

\[ \langle g, \rho_y (u_t + \frac{1}{2} u) \rangle \leq \frac{C}{4} \int_{\mathbb{R}^N} \rho_y (|u_t|^2 + |u|^2) + C \epsilon \int_{\mathbb{R}^N} \rho_y |g|^2. \]

Moreover, from (1.4) and (1.5) we have that

\[ k \int_{\mathbb{R}^N} \rho_y F(u) + \mu \int_{\mathbb{R}^N} \rho_y |u|^2 - C \mu \int_{\mathbb{R}^N} \rho_y \leq \int_{\mathbb{R}^N} \rho_y f(u) u \]

and

\[ -c_0 \int_{\mathbb{R}^N} \rho_y \leq \int_{\mathbb{R}^N} \rho_y F(u). \]

Substituting the estimates (4.2)- (4.4) into (4.1) simultaneously, choosing \( \eta \) and \( \epsilon \) small enough, we can obtain that

\[ \frac{1}{2} \frac{d}{dt} \int_{\mathbb{R}^N} \rho_y u + \frac{1}{2} u_t^2 + \frac{3}{4} \frac{d}{dt} \int_{\mathbb{R}^N} \rho_y |u|^2 + \frac{d}{dt} \int_{\mathbb{R}^N} \rho_y F(u) \]

\[ + \frac{1}{2} \int_{\mathbb{R}^N} \rho_y |\nabla u_t|^2 + C_{k, \nu} \int_{\mathbb{R}^N} \rho_y \left( |u_t + \frac{1}{2} u|^2 + |u|^2 + |\nabla u|^2 + F(u) \right) \]

\[ \leq C \epsilon \int_{\mathbb{R}^N} \rho_y |g|^2 + C \mu \int_{\mathbb{R}^N} \rho_y. \]

Denote

\[ E_1(t) = \int_{\mathbb{R}^N} \rho_y \left( |u_t(t) + \frac{1}{2} u(t)|^2 + \frac{1}{4} |u(t)|^2 + \frac{3}{2} |\nabla u(t)|^2 + 2F(u(t)) \right). \]

Then, using the Gronwall lemma, we obtain that

\[ E_1(t) \leq e^{-C_{k, \nu} t} E_1(0) + \frac{C \epsilon \mu}{C_{k, \nu}} \int_{\mathbb{R}^N} \rho_y (|g|^2 + 1). \]
Hence, we can conclude Theorem 1.1 immediately with a constant $q_0$ which only depends on $\|g\|_{L^2_{\infty}}, \int_{\mathbb{R}^N} \rho(x)dx$ and constants $k, \mu, \epsilon_0$. □

4.2. Strongly damped property. The following results reflect some kind of strongly damped property of $-\Delta u_t$ in some sense; see, e.g., [27, 28] for bounded domain cases.

Lemma 4.2. Under the assumptions of Theorem 3.2 there is a positive constant $q_1$ such that for any bounded (in $\mathcal{H}_0$) subset $B \subset W^{2,2}_{2\alpha} \times L^2_{\infty}$, there exists a positive constant $T_2 = T_2(B)$ which depends only on the $\mathcal{H}_0$-bound of $B$ such that

$$\|u(t)\|_{H^1_{2\alpha}} + \|u_t(t)\|_{H^1_{2\alpha}} \leq q_1 \text{ for all } t \geq T_2 \text{ and } (u_0, v_0) \in B.$$ 

Proof. Multiplying (1.1) by $\rho_y(u_{tt} + u_t)$, we have

$$\frac{d}{dt} \Lambda(\xi_u(t)) + \Gamma(\xi_u(t)) = 0,$$

where

$$\Lambda(\xi_u(t)) = \int_{\mathbb{R}^N} \rho_y |\nabla u_t|^2 + \int_{\mathbb{R}^N} \rho_y |\nabla u|^2 + 2\langle \nabla u, \rho_y \nabla u_t \rangle + 2\langle f(u), \rho_y u_t \rangle - 2\langle g, \rho_y u_t \rangle$$

and

$$\Gamma(\xi_u(t)) = \int_{\mathbb{R}^N} \rho_y |u_{tt} + u_t|^2 - \langle f'(u)u_t, \rho_y u_t \rangle + \langle f(u), \rho_y u_t \rangle - \langle g, \rho_y u_t \rangle + \langle \nabla u_t + \nabla u, \rho_y (u_{tt} + u_t) \rangle,$$

where $\xi_u(t) := (u(t), u_t(t))$ is the unique solution of (1.1) with initial data $(u_0, v_0)$.

Then,

$$\Gamma(\xi_u(t)) - \frac{1}{2} \Lambda(\xi_u(t)) = \int_{\mathbb{R}^N} \rho_y |u_{tt} + u_t|^2 - \langle f'(u)u_t, \rho_y u_t \rangle - \langle \nabla u, \rho_y \nabla u_t \rangle + \langle \nabla u_t + \nabla u, \rho_y (u_{tt} + u_t) \rangle - \frac{1}{2} \int_{\mathbb{R}^N} \rho_y |\nabla u_t|^2 - \frac{1}{2} \int_{\mathbb{R}^N} \rho_y |\nabla u|^2.$$

(4.9)

Note that

$$|2\langle \nabla u, \rho_y \nabla u_t \rangle| \leq \frac{1}{4} \int_{\mathbb{R}^N} \rho_y |\nabla u_t|^2 + 4 \int_{\mathbb{R}^N} \rho_y |\nabla u|^2,$$

and using Proposition 2.4 we have

$$|2\langle f(u), \rho_y u_t \rangle| \leq C \int_{\mathbb{R}^N} \rho_y (1 + |u| + |u|^{\frac{N+2}{N-2}}) |u_t|$$

$$\leq C \int_{\mathbb{R}^N} \rho_y(z) \int_{B(z,1)} (1 + |u(x)| + |u(x)|^{\frac{N+2}{N-2}}) |u_t(x)| dx dz$$

$$\leq C \int_{\mathbb{R}^N} \rho_y(z) (1 + \|u\|_{H^1(B(z,1))}) \|u_t\|_{H^1(B(z,1))} dz$$

$$\leq \frac{1}{4} \int_{\mathbb{R}^N} \rho_y (|\nabla u_t|^2 + |u_t|^2) + 8C(\int_{\mathbb{R}^N} \rho_y (|\nabla u|^2 + |u|^2 + 1)^{\frac{N+2}{N-2}}$$

and

$$|2\langle g, \rho_y u_t \rangle| \leq \frac{1}{4} \int_{\mathbb{R}^N} \rho_y |u_t|^2 + 4 \int_{\mathbb{R}^N} \rho_y |g|^2.$$
Then, we have that
\[
\Lambda(\xi_u(t)) \geq \frac{1}{2} \int_{\mathbb{R}^N} \rho_g(|\nabla u_t|^2 + |u_t|^2) - \int_{\mathbb{R}^N} \rho_g |u_t|^2 - 3 \int_{\mathbb{R}^N} \rho_g |\nabla u|^2
\]
(4.10)
\[\quad \quad \quad - 8C \left( \int_{\mathbb{R}^N} \rho_g (|\nabla u|^2 + |u|^2 + 1) \right)^{\frac{\nu+2}{\nu}} - 4 \int_{\mathbb{R}^N} \rho_g |g|^2\]
and
\[
\Lambda(\xi_u(t)) \leq 3 \int_{\mathbb{R}^N} \rho_g (|\nabla u|^2 + |u|^2) + 5 \int_{\mathbb{R}^N} \rho_g |\nabla u|^2
\]
(4.11)
\[\quad \quad \quad + 8C \left( \int_{\mathbb{R}^N} \rho_g (|\nabla u|^2 + |u|^2 + 1) \right)^{\frac{\nu+2}{\nu}} + 4 \int_{\mathbb{R}^N} \rho_g |g|^2.
\]
Furthermore, applying Proposition 2.4 again, we have
\[
| - \langle f'(u) u_t, \rho u_t \rangle | \leq C \|u\|_{L_{t,u}^\nu} \int_{\mathbb{R}^N} \rho_g (|\nabla u_t|^2 + |u_t|^2),
\]
\[
|\langle \nabla u, \rho g \nabla u_t \rangle | \leq \frac{1}{2} \int_{\mathbb{R}^N} \rho_g |\nabla u_t|^2 + \frac{1}{2} \int_{\mathbb{R}^N} \rho_g |\nabla u|^2;
\]
\[
|\langle \nabla u_t + \nabla u, \rho g (u_{tt} + u_t) \rangle | \leq C \eta \int_{\mathbb{R}^N} \rho_g (|u_{tt} + u_t|^2 + |\nabla u_t|^2 + |\nabla u|^2).
\]
Summarizing the above estimates into (4.9), and taking \(\eta\) small enough, we get that
\[
\Gamma(\xi_u(t)) - \frac{1}{2} \Lambda(\xi_u(t)) \geq \frac{1}{2} \int_{\mathbb{R}^N} \rho_g |u_{tt} + u_t|^2 + \frac{1}{4} \int_{\mathbb{R}^N} \rho_g |\nabla u_t|^2 - C \int_{\mathbb{R}^N} \rho_g (|\nabla u|^2 + |u|^2)
\]
\[\quad \quad \quad - C \|u\|_{L_{t,u}^\nu} \int_{\mathbb{R}^N} \rho_g (|\nabla u_t|^2 + |u_t|^2).
\]
Then, substituting the above inequality into (4.8), we obtain that
\[
\frac{1}{2} \frac{d}{dt} \Lambda(\xi_u(t)) + \frac{1}{2} \Lambda(\xi_u(t)) + \frac{1}{2} \int_{\mathbb{R}^N} \rho_g |u_{tt} + u_t|^2
\]
(4.12)
\[\quad \quad \quad \leq \int_{\mathbb{R}^N} \rho_g (|\nabla u|^2 + |u|^2) + C \|u\|_{L_{t,u}^\nu} \int_{\mathbb{R}^N} \rho_g (|\nabla u_t|^2 + |u_t|^2).
\]
Applying Theorem 4.1, we know that there is a \(T_1\) which depends on the \(H_0\)-bound of \(B\) such that
\[
\|u(t)\|_{H_{t,u}^2}^2 + \|u_t(t)\|_{L_{t,u}^2}^2 \leq \varrho_0 \quad \text{for all } t \geq T_1;
\]
therefore, we can rewrite (4.12) as follows: For all \(t \geq T_1\) and all \((u_0, v_0) \in B\), we have
\[
\frac{d}{dt} \Lambda(\xi_u(t)) + \Lambda(\xi_u(t)) \leq C_1 + C_2 \int_{\mathbb{R}^N} \rho_g |\nabla u_t|^2
\]
with two proper constants \(C_1\) and \(C_2\) which depend only on \(\varrho_0\) and \(\int_{\mathbb{R}^N} \rho dx\). Simultaneously, following (4.11), we have
\[
\Lambda(\xi_u(t)) \leq 3 \int_{\mathbb{R}^N} \rho_g |\nabla u_t|^2 + C_3 \quad \text{for all } t \geq T_1 \text{ and all } (u_0, v_0) \in B,
\]
where the constant \(C_3\) also depends only on \(\varrho_0\), \(\rho\) and \(\|g\|_{L_{t,u}^\nu}^\nu\).
On the other hand, we integrate (4.13) over \([t, t+1]\) for any \(0 \leq t < \infty\). Then
\[
\int_{t}^{t+1} \int_{\mathbb{R}^N} \rho_y |\nabla u_t|^2 \leq E_1(t) + C_{\mu,e} \int_{\mathbb{R}^N} \rho_y (|g|^2 + 1)
\]
(4.16)
\[
\leq e^{-C_{k,\mu} t} E_1(0) + C_{k,\mu,e} \int_{\mathbb{R}^N} \rho_y (|g|^2 + 1),
\]
where \(E_1(\cdot)\) is defined in (4.10). Especially, on the interval \([T_1, T_1 + 1]\) and using (4.13) again, we get that
\[
\int_{T_1}^{T_1 + 1} \int_{\mathbb{R}^N} \rho_y |\nabla u_t(s)|^2 ds dx \leq E_1(T_1) + C_{k,\mu,e} \int_{\mathbb{R}^N} \rho_y (|g|^2 + 1)
\]
(4.17)
\[
\leq C_{\rho_0} + C_{k,\mu,e} \int_{\mathbb{R}^N} \rho_y (|g|^2 + 1) \quad \text{for all} \quad (u_0, v_0) \in B,
\]
which, combined with (4.13), implies that for each initial data belonging to \(B\), there exists a \(\tau_0 \in [T_1, T_1 + 1]\) (which depends on the initial data) such that
\[
\Lambda(\xi_u(\tau_0)) \leq C_{\rho_0, k,\mu, e, g}.
\]
Therefore, applying the Gronwall lemma, we deduce from (4.14) that, for all \(t \geq T_1 + 1\),
\[
\Lambda(\xi_u(t)) \leq \Lambda(\xi_u(\tau_0)) e^{-(t - \tau_0)} + C_1 + C_2 (e^{-C_{k,\mu} (t-1)} + e^{-(t-1)}) E(0) + C_2 C_4,
\]
where \(C_1 = C_{k,\mu,e} \int_{\mathbb{R}^N} \rho_y (|g|^2 + 1)\), by which, noticing (4.10), (4.13) and (4.18), we have that
\[
\int_{\mathbb{R}^N} \rho_y (|\nabla u_t(t)|^2 + |u_t(t)|^2)
\]
(4.19)
\[
\leq C_{\rho_0, k,\mu, e, g} (e^{-(t - \tau_0)} + 1) + C_2 (e^{-C_{k,\mu} (t-1)} + e^{-(t-1)}) E(0).
\]
Hence, the conclusion of Lemma 4.2 follows from (4.19) and Theorem 4.1. □

Lemma 4.3. Under the assumption of Theorem 3.2, there is a positive constant \(\rho_2\) such that for any bounded (in \(H_0\)) subset \(B \subset \mathcal{W}_{1,2}^2 \times L^2_{\rho_1}\), there exists a positive constant \(T_3 = T_3(B)\) which depends only on the \(H_0\)-bound of \(B\) such that
\[
||u_{tt}(t)||_{L^2_{\rho_1}} \leq \rho_2 \quad \text{for all} \quad t \geq T_3 \quad \text{and} \quad (u_0, v_0) \in B.
\]

Proof. Set \(q = u_t\) and differentiate (1.1) with respect to time. This yields
\[
q_{tt} + q_t - \Delta q_t - \Delta q + f'(u)u_t = 0.
\]
(4.20)

Multiplying (4.20) by \(\rho_y q_t\), we have
\[
\frac{1}{2} \frac{d}{dt} \left( \int_{\mathbb{R}^N} \rho_y |q_t|^2 + \int_{\mathbb{R}^N} \rho_y |\nabla q_t|^2 \right) + \int_{\mathbb{R}^N} \rho_y |
\]
and applying Proposition 2.4, we have
\[ | - \langle f'(u_t), \rho_y q_t \rangle | \leq \frac{1}{2} \int_{\mathbb{R}^N} \rho_y |q_t|^2 + |\nabla q_t|^2 + \frac{C^2}{2} \parallel u_t \parallel_{H_{lu}^1}^2 \parallel u \parallel_{H_{lu}^1}^2. \]

Taking \( \eta \) small enough, for example \( C\sqrt{\eta} = \frac{1}{8} \), we get that
\[
\frac{d}{dt} \left( \int_{\mathbb{R}^N} \rho_y |q_t|^2 + \int_{\mathbb{R}^N} \rho_y |\nabla q|^2 \right) + \frac{1}{8} \left( \int_{\mathbb{R}^N} \rho_y |q_t|^2 + \int_{\mathbb{R}^N} \rho_y |\nabla q|^2 \right) \leq C_{\varrho_2}. \tag{4.21}
\]

Similarly, applying Theorem 4.1 and Lemma 4.2, we know that there exists a \( T_2 \) which depends only on the \( H_{lu}^1 \)-bound of \( B \) such that
\[
\|u(t)\|_{H_{lu}^1} + \|u_t(t)\|_{H_{lu}^1} \leq \varrho_1 \quad \text{for all } t \geq T_2 \text{ and } (u_0, v_0) \in B. \tag{4.22}
\]

Therefore, from (4.21) we have
\[
\frac{d}{dt} \left( \int_{\mathbb{R}^N} \rho_y |q_t|^2 + \int_{\mathbb{R}^N} \rho_y |\nabla q|^2 \right) + \frac{1}{4} \left( \int_{\mathbb{R}^N} \rho_y |q_t|^2 + \int_{\mathbb{R}^N} \rho_y |\nabla q|^2 \right) \leq C_{\varrho_2}. \tag{4.23}
\]

Moreover, integrating (4.12) over \([T_2, T_2 + 1]\), similar to (4.17), we have: for all \((u_0, v_0) \in B\),
\[
\int_{T_2}^{T_2+1} \int_{\mathbb{R}^N} \rho_y |u_{tt}|^2 \leq C_{\varrho_0, \varrho_1, \|g\|_{L_{lu}^2}},
\]
which implies that there exists a time \( \tau_1 \in [T_2, T_2 + 1] \) such that
\[
\int_{\mathbb{R}^N} \rho_y |u_{tt}(\tau_1)|^2 dx \leq C_{\varrho_0, \varrho_1, \|g\|_{L_{lu}^2}}. \tag{4.24}
\]

Therefore, using the Gronwall lemma, with (4.22) and (4.24), we know that for any \( t \geq T_2 + 1 \), the following inequality holds for any \((u_0, v_0) \in B\):
\[
\int_{\mathbb{R}^N} \rho_y (|q_t(t)|^2 + |\nabla q(t)|^2) \leq C_{\varrho_1, \varrho_0, \|g\|_{L_{lu}^2}} \left( e^{-\frac{(t-T_2)^2}{4}} + 1 \right). \tag{4.25}
\]

Note that the constant is independent of \( y \); then Lemma 4.3 follows immediately. \( \square \)

4.3. Continuity. In the following, we will deduce some continuity with respect to the \( H_{\omega}^1 \times L_{lu}^2 \)-norm for the solution given in Theorem 3.2.

Let \((u^i(t), u_t^i(t)) \ (i = 1, 2)\) be the corresponding solution of equation (1.1) to the initial data \((u_0^i, v_0^i) \in W_{\omega_{\omega}}^{2,2} \times L_{lu}^2\) and forcing \( g_i(x) \in L_{lu}^2\); then their difference \( z = u^1 - u^2\) satisfies the equation
\[
z_{tt} + z_t - \Delta z_t - \Delta z + f(u^1) - f(u^2) = g_1 - g_2,
\]
which is equivalent to the equation
\[
(z_t + \frac{1}{2}z)_t + \frac{1}{2}z_t - \Delta z_t - \Delta z + f(u^1) - f(u^2) = g_1 - g_2,
\]
with initial data \((z(0), z_t(0)) = (u_0^1 - u_0^2, v_0^1 - v_0^2)\).

Taking \(\rho_y(z_t + \frac{1}{2}z)\) as the test function, we have
\[
\langle (z_t + \frac{1}{2}z)_t, \rho_y(z_t + \frac{1}{2}z) \rangle + \frac{1}{2} \langle z_t, \rho_y(z_t + \frac{1}{2}z) \rangle - \langle \Delta z_t, \rho_y(z_t + \frac{1}{2}z) \rangle - \langle \Delta z, \rho_y(z_t + \frac{1}{2}z) \rangle
\]
\[
= -(f(u^1) - f(u^2), \rho_y(z_t + \frac{1}{2}z)) + \langle g_1 - g_2, \rho_y(z_t + \frac{1}{2}z) \rangle;
\]
recall that \(\langle \cdot, \cdot \rangle\) is the usual \(L^2(\mathbb{R}^N)\)-inner product.

In the following, we only estimate the nonlinear term, and the remainder terms can be dealt with in a similar manner as in Theorem 4.1.

Similar to (3.3), we have
\[
| - \int_{\mathbb{R}^N} \rho_y(f(u^1) - f(u^2)) z_t dx |
\]
\[
\leq C \int_{\mathbb{R}^N} \rho_y(x) (1 + |u^1|^{\frac{4}{N-2}} + |u^2|^{\frac{4}{N-2}})|z|^2 dx
\]
\[
\leq C \int_{\mathbb{R}^N} \rho_y(x) \int_{B(s,1)} (1 + |u^1|^{\frac{4}{N-2}} + |u^2|^{\frac{4}{N-2}})|z|^2 dx ds
\]
\[
\leq C \int_{\mathbb{R}^N} \rho_y(x) (|\nabla z|^2 + |z|^2) dx,
\]
where we used Proposition 2.4 and the growth condition (1.3), and the constant \(C\) here depends on the constants in Proposition 2.4 and the bounds of initial data \(\|u_0^i\|_{H^1_{\text{loc}}} (i = 1, 2)\). Note that, from the dissipative estimate (4.7), we know that the bounds of \(\|u^i(t)\|_{H^1_{\text{loc}}} (i = 1, 2)\) for \(t \in [0, T]\) depend only on the bounds of initial data.

Similarly, we have
\[
| - \int_{\mathbb{R}^N} \rho_y(f(u^1) - f(u^2)) z_t dx |
\]
\[
\leq C \int_{\mathbb{R}^N} \rho_y(s) \int_{B(s,1)} (1 + |u^1|^{\frac{4}{N-2}} + |u^2|^{\frac{4}{N-2}})|z|^2 dx ds
\]
\[
\leq C \|u_0^i\|_{H^1_{\text{loc}}} \int_{\mathbb{R}^N} \rho_y(s) \|z\|_{H^1(B(s,1))} |z_t|_{H^1(B(s,1))} ds
\]
\[
\leq C \|u_0^i\|_{H^1_{\text{loc}}} \eta \int_{\mathbb{R}^N} \rho_y(|\nabla z|^2 + |z|^2) dx + \eta \int_{\mathbb{R}^N} \rho_y(|\nabla z_t|^2 + |z_t|^2) dx.
\]

Therefore, summarizing all of the above estimates into (4.26), we obtain that
\[
\frac{d}{dt} \int_{\mathbb{R}^N} \rho_y(|z_t + \frac{1}{2}z|^2 + |\nabla z|^2 + |z|^2)
\]
\[
\leq C \int_{\mathbb{R}^N} \rho_y(|z_t + \frac{1}{2}z|^2 + |\nabla z|^2 + |z|^2) + \int_{\mathbb{R}^N} \rho_y|g_1 - g_2|^2,
\]
where the constant $C$ depends on the bounds of initial data $\|u_i^0\|_{H_i^{1\rho}}$ ($i = 1, 2$) and
$\eta$, but is independent of $y$. Then using the Gronwall lemma, we get the bounds
\[
\sup_{t \in [0, T]} \left( \|z(t)\|_{H_i^{1\rho}}^2 + \|z_i(t)\|_{L_i^{2\rho}}^2 \right)
\leq 4e^{CT} \left( \|z(0)\|_{H_i^{1\rho}}^2 + \|z_i(0)\|_{L_i^{2\rho}}^2 \right) + C^{-1}\|g_1 - g_2\|_{L_i^{2\rho}}^2 (e^{CT} - 1), \quad T > 0,
\]
and
\[
\sup_{t \in [0, T]} \left( \|z(t)\|_{H_i^{1\rho}}^2 + \|z_i(t)\|_{L_i^{2\rho}}^2 \right)
\leq 4e^{CT} \left( \|z(0)\|_{H_i^{1\rho}}^2 + \|z_i(0)\|_{L_i^{2\rho}}^2 \right) + C^{-1}\|g_1 - g_2\|_{L_i^{2\rho}}^2 (e^{CT} - 1), \quad T > 0.
\]
These justify that, when the initial data varies in a bounded (in $H$) set $B \subset W_i^{2,2} \times L_i^{2\rho}$, or the forcing $g$ varies in a bounded (in $L_i^{2\rho}$) set $\tilde{B} \subset L_i^{2\rho}$, the corresponding solution $(u, u_i)$ is continuous w.r.t. the initial data in the $H_i^{1\rho} \times L_i^{2\rho}$-norm and the forcing in the $L_i^{2\rho}$-norm, uniformly for $t$ varying on bounded subintervals of $[0, \infty)$. The same also holds for the $H_i^{1\rho} \times L_i^{2\rho}$-norm.

5. Global weak solution

In this section, based on the a priori estimates and continuities given in section 4, we will define the weak solution by extending the strong solution (in the sense of Theorem 5.2) to the whole of $H_i^{1\rho} \times L_i^{2\rho}$.

At first, from [11], we give the following definition about the weak $H_i^{1\rho} \times L_i^{2\rho}$
global solution to (1.1)–(1.2), which is slightly different from that in [11].

**Definition 5.1.** For each $g \in L_i^{2\rho}$ and any initial data $(u_0, v_0) \in H_i^{1\rho} \times L_i^{2\rho}$, the
function $(u, u_i) \in L^\infty([0, \infty), H_i^{1\rho} \times L_i^{2\rho})$ is called a global weak solution to (1.1)–
(1.2) iff there exist a bounded (in $L_i^{2\rho}$) sequence $\{g_n\}_{n=1}^\infty \subset L_i^{2\rho}$ and a bounded (in $H_i^{1\rho} \times L_i^{2\rho}$) sequence $\{(u_n(0), u_n(0))\}_{n=1}^\infty \subset W_i^{2,2} \times L_i^{2\rho}$, satisfying $g_n \to g$ in $L_i^{2\rho}$ and
$(u_n(0), u_n(0)) \to (u_0, v_0)$ in $H_i^{1\rho} \times L_i^{2\rho}$, such that the sequence $\{(u_n, u_{n1})\}$ of solutions, given in Theorem 3.2 and corresponding to forcing $g_n$ and initial data $(u_n(0), u_n(0))$, converges to $(u, u_i)$ in $C([0, T], H_i^{1\rho} \times L_i^{2\rho})$ on the compact interval $[0, T]$ for all $T > 0$.

**Remark 5.2.** The boundedness of $\{g_n\}$ and $\{(u_n(0), u_n(0))\}$ in Definition 5.1 are mainly for obtaining the uniform (w.r.t. $n$) a priori estimates of approximative solutions.

**Proposition 5.3** ([21, 28]). The closure in $H_i^{1\rho}$ ($r \geq 0$) of a bounded subset of
$H_i^{1\rho}$ consists of elements in a bounded subset of $H_i^{1\rho}$.

**Theorem 5.4.** Assume that $f$ satisfies (1.3)–(1.5) and $g \in L_i^{2\rho}$. Then for each
$(u_0, v_0) \in H_i^{1\rho} \times L_i^{2\rho}$, there is a unique global weak solution to problem (1.1)–(1.2),
which defines a continuous (w.r.t. the $H_i^{1\rho} \times L_i^{2\rho}$-norm) semigroup $\{S(t)\}_{t \geq 0}$ in $H_i^{1\rho} \times L_i^{2\rho}$.

**Proof.** The uniqueness follows from (1.29) directly. In the following, we only need to show the existence.

For each $(u_0, v_0) \in H_i^{1\rho} \times L_i^{2\rho}$ and each $g \in L_i^{2\rho}$, from Lemma 2.6 we know that
there exist $(u_{0n}, v_{0n}) \in W_i^{2,2} \times L_i^{2\rho}$ with $\{(u_{0n}, v_{0n})\}_{n=1}^\infty$ bounded in $H_i^{1\rho} \times L_i^{2\rho}$ and
$g_n \in L_i^{2\rho}$ with $\{g_n\}_{n=1}^\infty$ bounded in $L_i^{2\rho}$, such that $(u_{0n}, v_{0n}) \to (u_0, v_0)$ w.r.t. the
$H_i^{1\rho} \times L_i^{2\rho}$-norm and $g_n \to g$ w.r.t. the $L_i^{2\rho}$-norm.
From Theorem 3.2 we know that for each \((u_{0n}, v_{0n}) \in W^{2,2}_{lu} \times L^{2}_{lu}\) and \(g_n \in L^{2}_{lu}\), there is a unique global solution \((u_n(t), u_n(t))\) given by \((u_n(t), u_n(t)) = \tilde{S}_{g_n}(t)(u_{0n}, v_{0n}), n = 1, 2, \ldots, t \geq 0\), where \(\{\tilde{S}_{g_n}(t)\}_{t \geq 0}\) is the \(C^0\)-semigroup given in Theorem 3.2 corresponding to the forcing \(g_n\).

Now, for each \(g \in L^{2}_{lu}\) and any initial data \((u_0, v_0) \in H^{1}_{lu} \times L^{2}_{lu}\), define \(S_g(t): (u_0, v_0) \rightarrow \lim_{n \rightarrow \infty} \tilde{S}_{g_n}(t)(u_{0n}, v_{0n})\) in \(H^{1}_{\rho} \times L^{2}_{\rho}\) for every \(t \geq 0\).

Then, we claim that:

(i) \(S_g(t)(u_0, v_0) \in H^{1}_{lu} \times L^{2}_{lu}\). This follows from the boundedness (in \(H^{1}_{lu} \times L^{2}_{lu}\)) of \(\{(u_{0n}, v_{0n})\}_{n=1}^{\infty}\), the boundedness (in \(L^{2}_{lu}\)) of \(\{g_n\}_{n=1}^{\infty}\), Theorem 4.1 and Proposition 5.3.

(ii) \(S_g(t)(u_0, v_0)\) is independent of the choice of \(\{(u_{0n}, v_{0n})\}_{n=1}^{\infty}\) and \(\{g_n\}_{n=1}^{\infty}\). This follows from (4.29).

(iii) \(\{S_g(t)\}_{t \geq 0}\) forms a semigroup on \(H^{1}_{lu} \times L^{2}_{lu}\). This follows from the fact that \(\{\tilde{S}_{g_n}(t)\}_{t \geq 0}\) is a semigroup for each \(g_n\) and the continuity estimate (4.29).

(iv) \(S_g(t) : H^{1}_{lu} \times L^{2}_{lu} \rightarrow H^{1}_{lu} \times L^{2}_{lu}\) is continuous w.r.t. the \(H^{1}_{\rho} \times L^{2}_{\rho}\)-norm. This follows from (4.29).

(v) \(\tilde{S}_{g_n}(t)(u_{0n}, v_{0n})\) converges to \(S_g(t)(u_0, v_0)\) in \(C([0, T], H^{1}_{\rho}(\mathbb{R}^{N}) \times L^{2}_{\rho}(\mathbb{R}^{N}))\) on the compact interval \([0, T]\) for all \(T > 0\). This follows from (4.29).

(vi) \(S_g(t) = \tilde{S}_{g_n}(t)\) on \(H^{1}_{lu} \times L^{2}_{lu}\) for every \(t \geq 0\) provided that \(g \in L^{2}_{lu}\).

Hence, \(S_g(t)(u_0, v_0)\) is the unique global weak solution of (1.1)-(1.2) corresponding to the initial data \((u_0, v_0)\), where \(S_g(t)(u_0, v_0) \in L^{\infty}(0, \infty; H^{1}_{lu} \times L^{2}_{lu})\) follows from Theorem 4.1 and Proposition 5.3. \(\square\)

Remark 5.5. In Theorem 5.4 we use the a priori estimate (4.29) to guarantee the existence of a weak global \(H^{1}_{lu} \times L^{2}_{lu}\) solution semigroup \(\{S(t)\}_{t \geq 0}\), which indeed is an extension of \(\{\tilde{S}(t)\}_{t \geq 0}\) w.r.t. the weighted norm to phase space \(H^{1}_{lu} \times L^{2}_{lu}\) with the forcing \(g \in L^{2}_{lu}\).

On the other hand, as shown in (4.30), we also have the “strong” continuity w.r.t. the norm of uniform space. Hence, if we extend \(\{\tilde{S}(t)\}_{t \geq 0}\) with the uniform space norm, that is, we pass the limit in (5.1) with the uniform space norm, then we can also uniquely define a continuous semigroup, whose phase space is \(H^{1}_{lu} \times L^{2}_{lu}\) and with the forcing \(g \in L^{2}_{lu}\), which is just the semigroup defined in Cholewa & Dlotko (12).

Remark 5.6. In particular, (4.30) also implies the Lipschitz continuity of \(\{S(t)\}_{t \geq 0}\). That is, given any \(R > 0\) and any two initial data \(z_1, z_2 \in H_0\) with \(\|z_1\|_{H_0} \leq R\), \(i = 1, 2\), there holds

\[\|S(t)z_1 - S(t)z_2\|_{H_0} \leq e^{Ct} \|z_1 - z_2\|_{H_0}, \quad \forall \ t \geq 0.\]

Remark 5.7. In this paper, we define the weak solution semigroup by extending the strong continuous analytic semigroup generated by a sectorial operator, which is different from some previous literatures, e.g., the solution in the sense of distribution given in (16) (34). Although they start in a different manner, these two kinds of solutions are indeed the same.

Hereafter, we always take the following assumption.

Assumption 1. \(f\) satisfies (1.3)-(1.5), \(g \in L^{2}_{lu}\) and \(\{S(t)\}_{t \geq 0}\) is the semigroup corresponding to the global weak solutions of (1.1)-(1.2) in \(H^{1}_{lu} \times L^{2}_{lu}\).
6. Decomposition of the equations

For the nonlinear term \( f \), following the idea in [1], we have the following properties.

For a \( C^1 \)-function satisfying (6.3)-(6.5), the following decomposing properties hold:

there are constants \( C > 0 \) and \( \gamma \) satisfying \( 0 < \gamma < q + 1 \) such that \( f \) can be decomposed as \( f = f_0 + f_1 \) with \( f_0, f_1 \in C^1(\mathbb{R}) \) satisfying

\[
\begin{aligned}
&1. \quad |f_0(s)| \leq C(|s| + |s|^{q+1}) \quad \forall s \in \mathbb{R}, \\
&2. \quad f_0(s) \geq 0 \quad \forall s \in \mathbb{R}, \\
&3. \quad \exists \tilde{k}_0 \geq 1, \tilde{\mu}_0 > 0 \text{ such that } \forall \tilde{\mu} \in (0, \tilde{\mu}_0], \exists \tilde{C}_\mu \in \mathbb{R}, \\
&\quad \tilde{k}_0F_0(s) + \tilde{\mu}s^2 - \tilde{C}_\mu \leq sf_0(s) \quad \forall s \in \mathbb{R},
\end{aligned}
\]

and

\[
\begin{aligned}
&1. \quad |f_1(s)| \leq C(1 + |s|^{\gamma}) \quad \forall s \in \mathbb{R} \text{ with some } \gamma < q + 1, \\
&2. \quad \exists \tilde{k}_1 \geq 1, \tilde{\mu}_1 > 0 \text{ such that } \forall \tilde{\mu} \in (0, \tilde{\mu}_1], \exists \tilde{C}_\mu \in \mathbb{R}, \\
&\quad \tilde{k}_1F_1(s) + \tilde{\mu}s^2 - \tilde{C}_\mu \leq sf_1(s) \quad \forall s \in \mathbb{R}, \\
&3. \quad \exists \tilde{c}' \in \mathbb{R}, -\tilde{c}' \leq F_1(s) \quad \forall s \in \mathbb{R},
\end{aligned}
\]

where \( F_i(s) = \int_0^s f_i(\tau)d\tau, \ i = 0, 1. \)

For example, from (1.4)-(1.5) we know that there is an \( M > 0 \) such that

\[ kF(s) + \frac{\mu_1}{2}s^2 - C_{\mu_1} \geq 0 \quad \text{for all } |s| \geq M. \]

Taking a cutoff function \( \psi(s) \) satisfies

\[ \psi(s) = \begin{cases} 1, & |s| \geq 2M, \\ 0, & |s| \leq M. \end{cases} \]

Set

\[ f_0(s) = \psi(s)(f(s) - \frac{\mu_1}{2}s) \quad \text{and} \quad f_1(s) = f(s) - f_0(s) \]

for all \( s \in \mathbb{R}. \)

Then, we can verify that the above \( f_0, f_1 \) satisfies (6.1)-(6.2) respectively for some proper constants.

In order to obtain the latter regularity estimates, as in [27, 35], we decompose the solution \( S(t)(u_0, v_0) = (u(t), u_0(t)) \) into the sum

\[
S(t)(u_0, v_0) = D(t)(u_0, v_0) + K(t)(u_0, v_0),
\]

where \( D(t)(u_0, v_0) = (v(t), v_1(t)) \) and \( K(t)(u_0, v_0) = (w(t), w_1(t)) \) solve the following equations respectively:

\[
\begin{aligned}
&v_{tt} + v_t - \Delta v_t - \Delta v + f_0(v) + v = 0, \\
&(v(0), v_1(0)) = (u_0, v_0)
\end{aligned}
\]

and

\[
\begin{aligned}
w_{tt} + w_t - \Delta w_t - \Delta w + f(u) - f_0(v) - v = g(x), \\
&(w(0), w_1(0)) = 0.
\end{aligned}
\]
Note that \( \{D(t)\}_{t \geq 0} \) also forms a semigroup, but \( \{K(t)\}_{t \geq 0} \) may not, and we denote
\[
\sigma = \min\left\{ \frac{1}{4}, \frac{N + 2 - (N - 2)\gamma}{2} \right\},
\]
where \( \gamma \) is given in (6.2).

7. A priori estimates

In this section, we will establish some a priori estimates about the solutions of equations (6.4) and (6.5), which are the basis of our latter analysis.

Note that, according to the definition of weak solutions given in Definition 5.1 (especially the concrete expression (5.1), the continuity estimate (4.29) and Proposition 5.3), we know that for the a priori estimates of weak solutions, it suffices to deal first with the (approximative) strong solutions of (1.1)–(1.2), and then by passing the limit (as (5.1)) we can deduce the same estimates for weak solutions. Hence, hereafter, all a priori estimates in this paper are in the sense of strong solutions.

First, for convenience, we always denote by \( B_0 \) a bounded \((H_0, H_1)\)-absorbing set (obtained in Theorem 4.1) of \( \{S(t)\}_{t \geq 0} \) and set
\[
B_1 = \bigcup_{t \geq T_{B_0}} S(t)B_0,
\]
where \( T_{B_0} \) is the maximum time obtained in Theorem 4.1 and Lemmas 4.2 and 4.3 corresponding to \( B_0 \). Then, \( B_1 \) is also a bounded \((H_0, H_1 \times H_{1u})\)-absorbing set, and is positive invariant. Moreover, from the proof of Lemma 4.3 and the uniqueness of solutions, we also know that: for any initial data \((u_0, v_0)\) \( \in B_1 \), the following estimate holds:
\[
\|u(t)\|_{H_{1u}^2}^2 + \|u_t(t)\|_{H_{1u}^2}^2 + \|u_{tt}(t)\|_{L_2^2}^2 \leq C_{\varnothing_0, \varnothing_1, \varnothing_2}
\]
for all \( t \geq 0 \).

Second, from the conditions (6.1) of \( f_0 \), we can repeat the proofs of Theorem 4.1 and Lemmas 4.2 and 4.3 to get the following dissipation estimates about the semigroup \( \{D(t)\}_{t \geq 0} \):

**Lemma 7.1.** Under Assumption I and \( f_0 \) satisfying (6.1), the semigroup \( \{D(t)\}_{t \geq 0} \) generated by the solutions of equation (6.4) satisfies the following estimates:

(i) there exists a positive constant \( \varnothing_v \) such that for any bounded (in \( H_0 \)) set \( B \), there is a \( T = T(\|B\|_{\mathcal{H}_0}) \) such that
\[
\|v(t)\|_{H_{1u}^2}^2 + \|v_t(t)\|_{H_{1u}^2}^2 + \|v_{tt}(t)\|_{L_2^2}^2 \leq \varnothing_v,
\]
for all \( t \geq T \) and any \((u_0, v_0)\) \( \in B \);

(ii) \( D(t) \) maps the bounded set of \( \mathcal{H}_0 \) to be a uniformly (w.r.t. time \( t \)) bounded set; that is, for any \((u_0, v_0)\) \( \in \mathcal{H}_0 \),
\[
\|D(t)(u_0, v_0)\|_{\mathcal{H}_0}^2 \leq Q(\|(u_0, v_0)\|_{\mathcal{H}_0}) \quad \text{for all } t \geq 0.
\]

**Proof.** (i) is a repeat of Theorem 4.1 and Lemmas 4.2 and 4.3; (ii) is a direct result of (4.7). \( \square \)
Third, from the proof of Lemma 4.2 we can also see that if the initial data is more regular, e.g., \((u_0, v_0) \in B_1\), then one can get a further result, for example:

**Lemma 7.2.** Under Assumption I and \(f_0\) satisfying (6.1), there exists \(g_3\) which depends on the \(H_{u}^{1} \times H_{u}^{1}\)-bound of \(B_1\) such that

\[
\|v_t(t)\|_{H_{u}^{1}}^2 \leq g_3 \quad \text{for all} \ t \geq 0 \ \text{and all} \ (u_0, v_0) \in B_1,
\]

where \(B_1\) is given in (7.1) and \((v(t), v_t(t)) = D(t)(u_0, v_0)\) is the solution of (6.4).

**Proof.** This is a repeat of the proof of Lemma 4.2 word by word: we only need to apply the Gronwall lemma to a similar inequality as (4.14) for \(v(t)\), and note that now we can state that \(\tau_0\) (in (4.18) equals \(0\) since the initial data \((u_0, v_0)\) now belongs to \(H_{u}^{1} \times H_{u}^{1}\).

As a direct result of (7.5) and Lemmas 4.2 and 7.1 for the solutions \((w(t), w_t(t)) = K(t)(u_0, v_0)\) of equation (6.5), we have that there is a \(g_4\) which depends on the \(H_{u}^{1} \times H_{u}^{1}\)-bound of \(B_1\) such that

\[
\|w(t)\|_{H_{u}^{1}}^2 + \|w_t(t)\|_{H_{u}^{1}}^2 \leq g_4 \quad \text{for all} \ t \geq 0 \ \text{and all} \ (u_0, v_0) \in B_1.
\]

Furthermore, as in [5 23 27 29 30], for the solution of (6.4) we have the following exponential decay result:

**Lemma 7.3.** Under Assumption I and \(f_0\) satisfying (6.1), the solutions of equation (6.4) satisfy the following estimate: there exists a constant \(k_0\) such that for every \(t \geq 0\),

\[
\|D(t)(u_0, v_0)\|_{H_0}^2 = \|v(t)\|_{H_{u}^{1}}^2 + \|v_t(t)\|_{H_{u}^{1}}^2 \leq Q_1((u_0, v_0)) e^{-k_0 t},
\]

where \(Q_1(\cdot)\) is an increasing function on \([0, \infty)\) and \(k_0\) depends on the \(H_0\)-bound of \((u_0, v_0)\).

**Proof.** Multiplying (6.4) by \(\rho_y(v_t + \frac{1}{2}v)\), we get that (note again that here and after we will only give formal calculations for strong solutions which are obtained in Theorem 3.2 and for the weak solutions that are obtained in Theorem 6.4) we deduce by a limit approximation

\[
\frac{1}{2} \frac{d}{dt} \left( \int_{\mathbb{R}^N} \rho_y |v_t + \frac{1}{2}v|^2 + \frac{3}{4} \int_{\mathbb{R}^N} \rho_y |v_t|^2 + \frac{3}{4} \int_{\mathbb{R}^N} \rho_y |v|^2 + 2 \int_{\mathbb{R}^N} \rho_y F_0(v) \right) + \frac{1}{2} \int_{\mathbb{R}^N} \rho_y |v_t + \frac{1}{2}v|^2 + \int_{\mathbb{R}^N} \rho_y |v_t|^2 + \frac{1}{2} \int_{\mathbb{R}^N} \rho_y |v|^2 + \frac{1}{2} \int_{\mathbb{R}^N} \rho_y f_0(v) v \nu v = 0.
\]

By some standard calculations, we have

\[
\frac{1}{2} \frac{d}{dt} \left( \int_{\mathbb{R}^N} \rho_y |v_t + \frac{1}{2}v|^2 + \frac{3}{4} \int_{\mathbb{R}^N} \rho_y |v_t|^2 + \frac{3}{4} \int_{\mathbb{R}^N} \rho_y |v|^2 + 2 \int_{\mathbb{R}^N} \rho_y F_0(v) \right) + \frac{1}{2} \int_{\mathbb{R}^N} \rho_y |v_t + \frac{1}{2}v|^2 + \int_{\mathbb{R}^N} \rho_y |v_t|^2 + \frac{1}{2} \int_{\mathbb{R}^N} \rho_y |v|^2 + \frac{1}{2} \int_{\mathbb{R}^N} \rho_y f_0(v) v \nu v + 3 \int_{\mathbb{R}^N} \rho_y |v|^2 + \int_{\mathbb{R}^N} \nu v v \rho_y (v_t + \frac{1}{2}v) + \int_{\mathbb{R}^N} \nu v \nu \rho_y (v_t + \frac{1}{2}v) = 0,
\]

where

\[
\int_{\mathbb{R}^N} \nu v v \rho_y (v_t + \frac{1}{2}v) \leq C \sqrt{\eta} \int_{\mathbb{R}^N} \rho_y (|\nu v_t|^2 + |v_t + \frac{1}{2}v|^2)
\]
and
\[ | \int_{\mathbb{R}^N} \nabla \nabla \rho_y (v_t + \frac{1}{2} v^2) | \leq C \sqrt{\eta} \int_{\mathbb{R}^N} \rho_y (|\nabla v|^2 + |v_t + \frac{1}{2} v^2|). \]
Moreover, from (6.1) and (6.2), we have that
\[ (7.11) \]
\[ \int_{\mathbb{R}^N} \rho_y F_0 (v) \leq C \int_{\mathbb{R}^N} \rho_y (|v|^2 + |v|^{\frac{2N}{N - 2}}) \]
and
\[ F_0 (v) \geq 0 \quad \forall \ v \in \mathbb{R}; \quad f_0 (v) v \geq 0 \quad \forall \ v \in \mathbb{R}. \]

Now, applying Proposition 2.4 (several times), we have
\[ (7.9) \int_{\mathbb{R}^N} \rho_y (x) |v(x)|^{\frac{2N}{N - 2}} dx \leq C \| v \|_{H^1_0}^\frac{N}{N - 2} \int_{\mathbb{R}^N} \rho_y (x) \left(|v(x)|^2 + |\nabla v(x)|^2\right) dx, \]
which, combined with (7.8) and (7.4), implies that
\[ (7.10) \int_{\mathbb{R}^N} \rho_y F_0 (v(t)) \leq C \| (u_0, v_0) \|_{H_0^1} \int_{\mathbb{R}^N} \rho_y (|v(t)|^2 + |\nabla v(t)|^2) \quad \text{for all } t \geq 0. \]

Hence, choosing \( \eta \) small enough, we can obtain that there exists a \( k_0 > 0 \) (which is small and depends on the \( H_0 \)-bound of initial data (e.g., by (7.9) and (7.10))) such that
\[ (7.11) \frac{d}{dt} \left( \int_{\mathbb{R}^N} \rho_y |v_t + \frac{1}{2} v^2| + \frac{3}{2} \int_{\mathbb{R}^N} \rho_y |\nabla v|^2 + \frac{3}{4} \int_{\mathbb{R}^N} \rho_y |v|^2 \right) + 2 \int_{\mathbb{R}^N} \rho_y F_0 (v) + \frac{1}{2} \int_{\mathbb{R}^N} \rho_y |\nabla v_t|^2 \]
\[ + k_0 \left( \int_{\mathbb{R}^N} \rho_y |v_t + \frac{1}{2} v^2| + \frac{3}{2} \int_{\mathbb{R}^N} \rho_y |\nabla v|^2 + \frac{3}{4} \int_{\mathbb{R}^N} \rho_y |v|^2 \right) + 2 \int_{\mathbb{R}^N} \rho_y F_0 (v) \leq 0. \]
Then, applying the Gronwall lemma and noticing \( F_0 (v) \geq 0 \) again, we obtain that
\[ (7.12) \int_{\mathbb{R}^N} \rho_y |v_t + \frac{1}{2} v^2| + \frac{3}{2} \int_{\mathbb{R}^N} \rho_y |\nabla v|^2 + \frac{3}{4} \int_{\mathbb{R}^N} \rho_y |v|^2 \leq Q (\| \xi_0 (0) \|_{H_0^1}^2) e^{-k_0 t}. \]

For the solution of equation (6.5), we have the following regularity result:

**Lemma 7.4.** Under Assumption I and the decomposition (6.1)-(6.2) of \( f \), the solutions of equation (6.5) satisfy the following estimate: for any initial data \((u_0, v_0) \in B_1\), there exists a constant \( k_1 \) such that for every \( t \geq 0 \),
\[ (7.13) \| w_t (t) \|^2_{H^1_0} + \| w(t) \|^2_{H^1_0 + \sigma} \leq Q_2 (\| (u_0, v_0) \|_{H^1_0 \times H^1_0}, \| g \|_{L^2_0}) e^{k_1 t}, \]
where \( \sigma = \min \left\{ \frac{1}{2} N + 2 - (N - 2) \gamma \right\} \) is given in (6.6), \( Q_2 (\cdot) \) is an increasing function on \([0, \infty)\) and \( k_1 \) depends on \( \| (u_0, v_0) \|_{H^1_0 \times H^1_0}, \| g \|_{L^2_0} \).

The aim of this lemma is to obtain a higher regularity of \((w(t), w_t (t))\); naturally, we will use the intermediate spaces technique as used in previous references; e.g. [1 6 13 27].
Proof of Lemma 7.4. Let \( \theta \) be a smooth function satisfying \( 0 \leq \theta(s) \leq 1 \) for \( s \in [0, \infty) \), and
\[
\theta(s) = 1 \text{ for } 0 \leq s \leq \frac{1}{2}; \quad \theta(s) = 0 \text{ for } s \geq 1.
\]
Set \( \theta_y(x) = \theta(|x - y|) \). Multiplying (6.5) by \( \theta_y A^\sigma(\theta_y w_t) \), we have
\[
\frac{1}{2} \frac{d}{dt} \int_{\mathbb{R}^N} |A^\sigma(\theta_y w_t)|^2 + \int_{\mathbb{R}^N} |A^\sigma(\theta_y w_t)|^2 - (\Delta w_t, \theta_y A^\sigma(\theta_y w_t))
\leq \int_{\mathbb{R}^N} (f(u) - f(v) + f_1(v), \theta_y A^\sigma(\theta_y w_t))
= \langle g + v, \theta_y A^\sigma(\theta_y w_t) \rangle.
\]
We deal with each term above one by one:
\[
-\langle \Delta w_t, \theta_y A^\sigma(\theta_y w_t) \rangle = \int_{\mathbb{R}^N} \frac{1}{2} |A^{\sigma\sigma}(\theta_y w_t)|^2 + (2\Delta \theta_y w_t + 2\nabla \theta_y \cdot \nabla w_t, \theta_y A^\sigma(\theta_y w_t))
\]
where, since \( \sigma < \frac{1}{2} \), by the continuous embedding, we have
\[
|\Delta \theta_y w_t + 2\nabla \theta_y \cdot \nabla w_t, \theta_y A^\sigma(\theta_y w_t)| \leq C ||w_t(t)||_{H^1} \left( \int_{\mathbb{R}^N} |A^\sigma(\theta_y w_t)|^2 \right)^{\frac{1}{2}}
\leq C ||w_t(t)||_{H^1}.
\]
Similarly,
\[
-\langle \Delta w, \theta_y A^\sigma(\theta_y w_t) \rangle = \frac{1}{2} \frac{d}{dt} \int_{\mathbb{R}^N} |A^{\sigma\sigma}(\theta_y w_t)|^2 + (\Delta \theta_y w + 2\nabla \theta_y \cdot \nabla w, \theta_y A^\sigma(\theta_y w_t))
\]
and
\[
|\Delta \theta_y w + 2\nabla \theta_y \cdot \nabla w, \theta_y A^\sigma(\theta_y w_t)| \leq C ||w(t)||_{H^1} \left( \int_{\mathbb{R}^N} |A^\sigma(\theta_y w_t)|^2 \right)^{\frac{1}{2}}
\leq C ||w(t)||_{H^1} ||w_t(t)||_{H^1}.
\]
On the other hand, since \( \sigma \leq \frac{N+2-(N-2)\gamma}{2} \), by (6.2) we have
\[
|(f_1(v), \theta_y A^\sigma(\theta_y w_t))|
\leq C \int_{\mathbb{R}^N} \theta_y (1 + |v|^\gamma) |A^\sigma(\theta_y w_t)|
\leq C \left( \int_{\mathbb{R}^N} |A^\sigma(\theta_y w_t)| \right)^{\frac{2N-2+2\sigma}{N}} \left( \int_{B(y,1)} (1 + |v|^\gamma) \right)^{\frac{2N}{2N-2\sigma}}
\leq C(1 + ||v||_{H^1}^\gamma) \left( ||\theta_y w_t||_{L^2} + ||A^{\sigma\sigma}(\theta_y w_t)||_{L^2} \right).
\]
By virtue of (1.3),
\[
|(f(u) - f(v), \theta_y A^\sigma(\theta_y w_t))|
\leq C \int_{\mathbb{R}^N} \theta_y |w|(1 + |u|^{\frac{1}{p_1}} + |v|^{\frac{1}{p_2}}) |A^\sigma(\theta_y w_t)|
\leq C \left( \int_{\mathbb{R}^N} |A^\sigma(\theta_y w_t)|^{p_1} \right)^{\frac{1}{p_1}} \left( \int_{\mathbb{R}^N} |\theta_y w|^{p_2} \right)^{\frac{1}{p_2}} \left( \int_{B(y,1)} (1 + |u|^{\frac{1}{p_1}} + |v|^{\frac{1}{p_2}}) \right)^{\frac{2N}{2N-2\sigma}}
\leq C \left( ||\theta_y w_t||_{L^2} + ||A^{\sigma\sigma}(\theta_y w_t)||_{L^2} \right) \left( ||\theta_y w||_{L^2} + ||A^{\sigma\sigma}(\theta_y w)||_{L^2} \right),
\]
where \( p_1 = \frac{2N}{N-2+2\sigma}, \quad p_2 = \frac{2N}{N-2-2\sigma} \) and \( \sigma \leq \frac{1}{4} < \frac{N-2}{2} \).
Finally, noting \( \sigma < \frac{1}{2} \) again, we have
\[
|\langle g + v, \theta_y A^\sigma(\theta_y w_t) \rangle| \leq \|g + v\|_{L^2} \|w_t(t)\|_{H^1_U}.
\]
Therefore,
\[
\frac{1}{2} \frac{d}{dt} \left( \int_{\mathbb{R}^N} |A^\frac{\sigma}{2}(\theta_y w_t)|^2 + \int_{\mathbb{R}^N} |A^{\frac{\sigma+1}{2}}(\theta_y w)|^2 \right)
\leq k_1 \left( \int_{\mathbb{R}^N} |A^\frac{\sigma}{2}(\theta_y w_t)|^2 + \int_{\mathbb{R}^N} |A^{\frac{\sigma+1}{2}}(\theta_y w)|^2 \right) + C_s \|v\|_{H^1_{U^t}}, \|w_t(t)\|_{H^1_{U^t}}, \|w(t)\|_{H^1_{U^t}},
\]
where \( k_1 \) depends on \( C_s \|v\|_{H^1_{U^t}}, \|w_t(t)\|_{H^1_{U^t}}, \|w(t)\|_{H^1_{U^t}} \). Note that, from Lemma 7.3 and (7.6), we know that \( \|w_t(t)\|_{H^1_{U^t}} \) and \( \|w(t)\|_{H^1_{U^t}} \) only depend on \( \|(u_0, v_0)\|_{H^1_U \times H^1_U} \) and \( \|g\|_{L^2_{s\nu}} \).

Hence, applying the Gronwall lemma, we get that
\[
\int_{\mathbb{R}^N} |A^\frac{\sigma}{2}(\theta_y w_t)|^2 + \int_{\mathbb{R}^N} |A^{\frac{\sigma+1}{2}}(\theta_y w)|^2 \leq Q_2(\|u_0, v_0\|_{H^1_U \times H^1_U}, \|g\|_{L^2_{s\nu}})(e^{k_1 t} - 1).
\]
After taking the supremum with respect to \( y \in \mathbb{R}^N \), we indeed get that
\[
\|A^{\frac{\sigma}{2}} w(t)\|_{L^2_U}^2 + \|A^{\frac{\sigma+1}{2}} w(t)\|_{L^2_U}^2 \leq Q_2(\|u_0, v_0\|_{H^1_U \times H^1_U}, \|g\|_{L^2_{s\nu}})e^{k_1 t},
\]
which, combined with Lemma 2.2 and (7.6), implies (7.13).

8. Asymptotic regularity of the solutions

In this section, we will show by some bootstrap arguments that there indeed exists a more regular (bounded in \( H^1_U \times H^1_U \)) set \( B_1 \) which attracts exponentially (w.r.t. the \( H^1_{U^t} \)-norm) any \( H^1_{U^t} \)-bounded set.

Similar to that in Zelik [35], based on Lemma 7.3 and Lemma 7.4 for the solution \( (u(t), u_t(t)) \) started from the initial data which belongs to \( B_1 \) (given in (7.11)), we can decompose it as follows:

**Lemma 8.1.** Under Assumption I, let \( (u(t), u_t(t)) \) be the solution of (1.1)–(1.2) corresponding to the initial data \( z_0 = (u_0, v_0) \in B_1 \). Then, for every \( \varepsilon > 0 \) there exist positive constants \( C_\varepsilon \) (which depends only on the \( H^1_{U^t} \)-bound of \( B_1 \)) and \( K_\varepsilon \) (which depends on \( \varepsilon \) and the \( H^1_U \times H^1_U \)-bound of \( B_1 \)), such that
\[
(8.1) \quad u(t) = v(t) + w(t) \quad \text{for all } t \geq 0,
\]
where \( v(t), w(t) \) satisfy the following estimates:
\[
(8.2) \quad \|w(t)\|_{H^1_{U^t}}^2 \leq K_\varepsilon \quad \text{for all } t \geq 0
\]
and, for every \( t \geq s \geq 0 \),
\[
(8.3) \quad \int_s^t \|v(t)\|_{H^1_{U^t}}^2 \, dt \leq \varepsilon(t - s) + C_\varepsilon.
\]

The proof of this lemma is similar to that in [35].

**Proof.** From the definition of \( B_1 \) in (7.11), we know that
\[
\sup_{t \geq 0} \|S(t)z_0\|_{H^1_{U^t}}^2 \leq g_1 \quad \text{for all } z_0 \in B_1,
\]
where \( g_1 \) is given in Theorem 4.1.
Now, taking \( T \geq \frac{1}{c_0} \ln \frac{Q_1(\varepsilon)}{\varepsilon} \) (where \( Q_1(\cdot) \) is the function in Lemma 7.3), and in every interval \([mT, (m+1)T), m = 1, 2, \ldots\), we set
\[
v_1(t) = v(t) \quad \text{and} \quad w_1(t) = w(t),
\]
where \( v(t) \) and \( w(t) \) are the solutions of (6.3) and (6.5) respectively in the interval \([(m-1)T, (m+1)T)\) with the initial data \((v((m-1)T), v_t((m-1)T)) = (u((m-1)T), u_t((m-1)T))\) and \((w((m-1)T), w_t((m-1)T)) = (0, 0)\).

And in interval \([0, T)\), we set
\[
v_1(t) = v(t) \quad \text{and} \quad w_1(t) = w(t),
\]
where \( v(t) \) and \( w(t) \) are the solutions of (6.4) and (6.5) respectively in the interval \([0, T)\) with the initial data \((v'(0), v_t(0)) = z_0 \) and \((w(0), w_t(0)) = (0, 0)\).

Then from Lemma 7.3 we have
\[
\int_s^t \|v_1(\nu)\|_{H_1^0}^2 \, d\nu \leq \varepsilon(t - s) + \chi_{([0, T)]}(s)Q_1(\varepsilon) \quad \text{for all } t \geq s \geq 0,
\]
and from Lemma 8.1 we have
\[
\|w_1(t)\|_{H_1^{1+\sigma}}^2 \leq Q_2(\|z_0\|_{H_1^0 \times H_1^0}, \|g\|_{L^2_{\text{per}}})e^{2k_1T} \quad \text{for all } t \geq 0,
\]
where \( \chi_{([0, T)]}(s) \) is the characteristic function of set \([0, T)\). \( \square \)

Remark 8.2. From the proof of Lemma 8.1 we observe that the decomposition \( v_1(t) \) and \( w_1(t) \) can also further satisfy that
\[
\|v_1(t)\|_{H_1^0}^2 \leq Q_1(\varepsilon) \quad \text{for all } t \geq 0.
\]

In what follows we begin to establish the asymptotic regularity of the solutions. We claim first that

Lemma 8.3. Under Assumption I, there exists a constant \( J_\sigma \) which depends only on \( H_1^0 \times H_1^0 \)-bound of \( B_1 \) such that
\[
\|K(t)z_0\|_{H_{\sigma}}^2 = \|w(t)\|_{H_1^{1+\sigma}}^2 + \|w_1(t)\|_{H_1^0}^2 \leq J_\sigma \quad \text{for all } t \geq 0 \text{ and } \|z_0\|_{B_1},
\]
where \( \sigma = \min\left\{ \frac{1}{2}, \frac{N+2-(N-2)\gamma}{2} \right\} \) is given in (6.6).

Proof. Due to (7.6) and the continuous embedding \( H_1^0 \hookrightarrow H_1^\sigma \) for any \( 0 \leq \sigma \leq 1 \), we only need to prove \( \|w(t)\|_{H_1^{1+\sigma}}^2 \leq J_\sigma \) for some constant \( J_\sigma \).

Let \( \theta \) and \( \theta_y(x) = \theta(|x - y|) \) as in Lemma 7.4.

Multiplying (6.5) by \( \theta_y A^\sigma(\theta_y w(t)) \), we have
\[
\langle w_t(t), \theta_y A^\sigma(\theta_y w(t)) \rangle + \langle w_1(t), \theta_y A^\sigma(\theta_y w(t)) \rangle - \langle \Delta w(t), \theta_y A^\sigma(\theta_y w(t)) \rangle - \langle \Delta w_1(t), \theta_y A^\sigma(\theta_y w(t)) \rangle + \langle f(t) - f_0(v), \theta_y A^\sigma(\theta_y w(t)) \rangle
\]
\[
= \langle g(x) + v(t), \theta_y A^\sigma(\theta_y w(t)) \rangle.
\]
Similar to Lemma 7.4 in the following we will deal with each term in (8.4) one by one:

\[(8.5) \quad \langle w_t, \theta_y A^\sigma(\theta_y w(t)) \rangle = \frac{d}{dt} \langle (\theta_y w)_t, A^\sigma(\theta_y w(t)) \rangle - \langle (\theta_y w)_t, A^\sigma(\theta_y w(t)) \rangle,\]

\[(8.6) \quad |\langle w_t(t), \theta_y A^\sigma(\theta_y w(t)) \rangle| \leq \|w_t(t)\|_{L^2}^2 \left( \int_{\mathbb{R}^N} |A^\sigma(\theta_y w(t))|^2 \right)^{\frac{1}{2}},\]

\[(8.7) \quad \langle -\Delta w_t(t), \theta_y A^\sigma(\theta_y w(t)) \rangle = \frac{1}{2} \frac{d}{dt} \int_{\mathbb{R}^N} |A^{\frac{1+\sigma}{2}}(\theta_y w)|^2 + \langle 2\nabla \theta_y \cdot \nabla w_t + \Delta \theta_y w_t, A^\sigma(\theta_y w) \rangle\]

and

\[(8.8) \quad \langle -\Delta w(t), \theta_y A^\sigma(\theta_y w(t)) \rangle = \int_{\mathbb{R}^N} |A^{\frac{1+\sigma}{2}}(\theta_y w)|^2 + \langle 2\nabla \theta_y \cdot \nabla w + \Delta \theta_y w, A^\sigma(\theta_y w) \rangle,\]

where

\[|\langle 2\nabla \theta_y \cdot \nabla w_t + \Delta \theta_y w_t, A^\sigma(\theta_y w) \rangle| \leq C \|w_t(t)\|_{H^1}^2 \left( \int_{\mathbb{R}^N} |A^\sigma(\theta_y w(t))|^2 \right)^{\frac{1}{2}},\]

\[(8.9) \quad |\langle 2\nabla \theta_y \cdot \nabla w + \Delta \theta_y w, A^\sigma(\theta_y w) \rangle| \leq C \|w(t)\|_{H^1}^2 \left( \int_{\mathbb{R}^N} |A^\sigma(\theta_y w(t))|^2 \right)^{\frac{1}{2}}.\]

For the nonlinearity, applying (1.3) and Lemma 8.1 we have

\[|\langle f(u) - f(v), \theta_y A^\sigma(\theta_y w(t)) \rangle| \leq C \int_{\mathbb{R}^N} (1 + |u|^\frac{4}{N} + |v|^\frac{4}{N}) \theta_y |w||A^\sigma(\theta_y w)|,\]

\[(8.10) \quad \int_{\mathbb{R}^N} |u|^\frac{4}{N} \theta_y |w||A^\sigma(\theta_y w)| \leq C \int_{\mathbb{R}^N} (|v_1|^\frac{4}{N} + |w_1|^\frac{4}{N}) \theta_y |w||A^\sigma(\theta_y w)|.\]

Obviously,

\[(8.11) \quad \int_{\mathbb{R}^N} \theta_y |w||A^\sigma(\theta_y w)| \leq C \|w\|_{L^2} \|A^\sigma(\theta_y w)\|_{L^2}\]

and

\[\int_{\mathbb{R}^N} \theta_y |w||v_1|^\frac{4}{N} |A^\sigma(\theta_y w)|\]

\[\leq C \left( \int_{B(y, 1)} |v_1|^\frac{4}{N} \right)^{\frac{1}{2}} \left( \int_{\mathbb{R}^N} \theta_y |w|^\frac{4N}{N-2\sigma} \right)^{\frac{N-2\sigma}{2N}} \left( \int_{\mathbb{R}^N} |A^\sigma(\theta_y w)|^\frac{2N}{N-2\sigma} \right)^{\frac{N-2\sigma}{2N}} \]

\[\leq C \|v_1\|_{H^{\frac{4}{N}}}^2 \left( \|\theta_y w\|_{L^2} + \|A^{\frac{1+\sigma}{2}}(\theta_y w)\|_{L^2} \right) \left( \|A^\sigma(\theta_y w)\|_{L^2} + \|A^{\frac{1+\sigma}{2}}(\theta_y w)\|_{L^2} \right) \]

\[(8.12) \quad \leq C_M \|v_1\|_{H^{\frac{4}{N}}}^2 \int_{\mathbb{R}^N} |A^{\frac{1+\sigma}{2}}(\theta_y w)|^2 + \frac{1}{8} \int_{\mathbb{R}^N} |A^{\frac{1+\sigma}{2}}(\theta_y w)|^2 + C_M(1 + \|\theta_y w\|_{L^2}^2),\]
where we used Remark 8.2 and where the constant $C_M$ depends on the $\mathcal{H}_0$-bound of $B_1$.

Moreover, using (8.2) we have

$$\int_{R^N} |\theta_y| |v| |\frac{1}{N-1} A^\sigma(\theta_y w)|$$

$$\leq C \left( \int_{B(y,1)} |v|^{\frac{2N}{N-2}} \right) \left( \int_{R^N} |\theta_y| |\frac{1}{N-1} A^\sigma(\theta_y w)| \right) \left( \int_{R^N} |A^\sigma(\theta_y w)|^{\frac{2N}{N-2}} \right)^\frac{N-2-2\sigma}{N}$$

$$\leq C \|v\| H^\frac{1}{2}_u \|\theta_y w\| L^2 + \|A^\frac{1+\sigma}{2}(\theta_y w)\| L^2 \left( \|A^\sigma(\theta_y w)\| L^2 + \|A^\frac{1+\sigma}{2}(\theta_y w)\| L^2 \right)$$

(8.13)

$$\leq \frac{1}{8} \int_{R^N} |A^\frac{1+\sigma}{2}(\theta_y w)|^2 + C K (1 + \|\theta_y w\|^2_{L^2}),$$

where $p = \frac{2N(N-2)}{(N-2)^2 - 2(N-6)} < \frac{2N}{N-2-2\sigma}$, and we also used the interpolation inequality.

On the other hand, we have

$$\int_{R^N} |\theta_y| |v| |\frac{1}{N-1} A^\sigma(\theta_y w)|$$

$$\leq C \left( \int_{B(y,1)} |v|^{\frac{2N}{N-2}} \right) \left( \int_{R^N} |\theta_y| |\frac{1}{N-1} A^\sigma(\theta_y w)| \right) \left( \int_{R^N} |A^\sigma(\theta_y w)|^{\frac{2N}{N-2}} \right)^\frac{N-2-2\sigma}{N}$$

$$\leq C \|v\| H^\frac{1}{2}_u \|\theta_y w\| L^2 + \|A^\frac{1+\sigma}{2}(\theta_y w)\| L^2 \left( \|A^\sigma(\theta_y w)\| L^2 + \|A^\frac{1+\sigma}{2}(\theta_y w)\| L^2 \right)$$

(8.14)

$$\leq C_M \|v\| H^\frac{1}{2}_u \int_{R^N} |A^\frac{1+\sigma}{2}(\theta_y w)|^2 + C_M (1 + \|\theta_y w\|^2_{L^2}),$$

and thanks to Lemmas 7.1 and 7.3 we can take $T_1$ large enough such that

$$\|v(t)\| H^\frac{1}{2}_u \leq \frac{1}{8C_M}$$

for all $t \geq T_1$.

Finally, for the subcritical term, we have

$$|\langle f_1(v), \theta_y A^\sigma(\theta_y w) \rangle| \leq C \int_{R^N} (1 + |v|^\sigma) \theta_y |A^\sigma(\theta_y w)|$$

$$\leq C \left( 1 + \int_{B(y,1)} \theta_y |v|^\gamma \right) \left( \int_{R^N} |A^\sigma(\theta_y w)|^{\frac{2N}{N-2}} \right)^\frac{N-2-2\sigma}{N}$$

$$\leq C (1 + \|v\|^{\gamma}_{H^\frac{1}{2}}) \left( \|A^\sigma(\theta_y w)\| L^2 + \|A^\frac{1+\sigma}{2}(\theta_y w)\| L^2 \right)$$

(8.15)

$$\leq C_M (1 + \|\theta_y w\|^2_{L^2}) + \frac{1}{8} \int_{R^N} |A^\frac{1+\sigma}{2}(\theta_y w)|^2,$$

and for the forcing term, we have

$$|\langle g + v, \theta_y A^\sigma(\theta_y w) \rangle| \leq C (\|g\|_{L^2} + \|v\|_{L^2}) \left( \int_{R^N} |A^\sigma(\theta_y w)|^2 \right)^\frac{1}{2}.$$
Hence, summarizing the above estimates into (8.14), and due to (7.6), we have: for all \( t \geq T_1 \),
\[
\frac{d}{dt} \int_{\mathbb{R}^N} \left( |A^{\frac{1+p}{2}}(\theta_y w(t))|^2 + 2(\theta_y w)_t \cdot A^\circ(\theta_y w) \right) + \int_{\mathbb{R}^N} |A^{\frac{1+p}{2}}(\theta_y w(t))|^2 dt 
\leq C_M \|v_1(t)\|_{H^1_0}^2 \int_{\mathbb{R}^N} |A^{\frac{1+p}{2}}(\theta_y w(t))|^2 + C_M K_e \|g\|_{L^2_0},
\]
(8.16)
then, noting (8.6), (7.6) and Remark 8.2 again, we get finally that
\[
\frac{d}{dt} E_2(t) + (1 - C_M \|v_1(t)\|_{H^1_0}^2) E_2(t) \leq C',
\]
(8.17)
where \( E_2(t) = \int_{\mathbb{R}^N} \left( |A^{\frac{1+p}{2}}(\theta_y w(t))|^2 + 2(\theta_y w(t))_t \cdot A^\circ(\theta_y w(t)) \right) dt \), and the positive constant \( C' \) depends on the \( H^1_0 \times H^1_0 \)-bound of \( B_1, K_e \) and \( \|g\|_{L^2_0} \).

Therefore, applying the Gronwall inequality and integrating over \([1 + T_1, t] \), we obtain that
\[
E_2(t) \leq e^{- \int_{T_1+1}^{t} (1 - C_M \|v_1(s)\|_{H^1_0}^2) ds} E_2(1 + T_1) + C' \int_{T_1+1}^{t} e^{(1 - C_M \|v_1(\tau)\|_{H^1_0}^2)} d\tau ds. 
\]
(8.18)
Taking \( \varepsilon \) (in \( 8.3 \)) small enough (for example) such that \( \varepsilon < \frac{1}{2C_M} \), we have
\[
\int_{T_1+1}^{t} e^{(1 - C_M \|v_1(\tau)\|_{H^1_0}^2)} d\tau ds \leq e^{C_M C_\varepsilon} \int_{T_1+1}^{t} e^{(1 - C_M \varepsilon)(s-t)} ds \leq e^{C_M C_\varepsilon} \int_{T_1+1}^{t} e^{(s-t)/2} ds \leq 2e^{C_M C_\varepsilon}
\]
and
\[
e^{- \int_{T_1+1}^{1} (1 - C_M \|v_1(s)\|_{H^1_0}^2) ds} \leq e^{- \varepsilon (t - T_1 - 1)} e^{C_M C_\varepsilon}.
\]
(8.19)
Substituting (8.19)-(8.20) into (8.18) and using (7.6) again, we can get that, for all \( t \geq 1 + T_1 \),
\[
\int_{\mathbb{R}^N} |A^{\frac{1+p}{2}}(\theta_y w(t))|^2 \leq e^{- \frac{\varepsilon}{2}(t - T_1 - 1)} e^{C_M C_\varepsilon} \int_{\mathbb{R}^N} |A^{\frac{1+p}{2}}(\theta_y w(1 + T_1))|^2 + C' e^{C_M C_\varepsilon}.
\]
Hence, noting again that Lemma 7.3 and \( T_1 \) is fixed, the proof is completed. \( \square \)

**Lemma 8.4.** Assume \( B_\sigma \subset B_1 \) and \( B_\sigma \) is bounded in \( \mathcal{H}_\sigma \). Then there exists a constant \( M_\sigma > 0 \) which depends only on the \( \mathcal{H}_\sigma \)-bound of \( B_\sigma \) such that
\[
\|S(t)B_\sigma\|_{\mathcal{H}_\sigma} \leq M_\sigma \quad \text{for all} \quad t \geq 0.
\]
**Proof.** Multiplying (1.1) by \( \theta_y A^\circ(\theta_y u_t(t) + \theta_y u(t)) \), we have
\[
\frac{1}{2} \frac{d}{dt} \int_{\mathbb{R}^N} |A^{\frac{1+p}{2}}(\theta_y u_t(t) + \theta_y u(t))|^2 - (\Delta u_t, \theta_y A^\circ(\theta_y u_t(t) + \theta_y u(t))) 
- \langle \Delta u, \theta_y A^\circ(\theta_y u_t(t) + \theta_y u(t)) \rangle + \langle f(u), \theta_y A^\circ(\theta_y u_t(t) + \theta_y u(t)) \rangle
\]
(8.22)
Here we only deal with the nonlinear term; we can deal with the other terms by similar calculations used in previous lemmas.
We will use Lemma \[8.1\] at first,

\[
(f(u), \theta_y A^\sigma (\theta_y u_1(t) + \theta_y u(t))) \leq C \int_{\mathbb{R}^N} \theta_y (1 + |u|^{\frac{N+2}{N-2}}) |A^\sigma (\theta_y u_1(t) + \theta_y u(t))|,
\]

and from \[8.1\] we have

\[
\int_{\mathbb{R}^N} \theta_y |u|^{\frac{N+2}{N-2}} |A^\sigma (\theta_y u_1)| = \int_{\mathbb{R}^N} \theta_y |u|^{\frac{N+2}{N-2}} |u||A^\sigma (\theta_y u_1)| \\
\leq \int_{\mathbb{R}^N} \theta_y |v_1 + w_1|^{\frac{N+2}{N-2}} |u||A^\sigma (\theta_y u_1)| \\
\leq C \int_{\mathbb{R}^N} \theta_y (|v_1|^{\frac{N+2}{N-2}} + |w_1|^{\frac{N+2}{N-2}})|u||A^\sigma (\theta_y u_1)|.
\]

Here,

\[
\int_{\mathbb{R}^N} \theta_y |v_1|^{\frac{N+2}{N-2}} |u||A^\sigma (\theta_y u_1)| \\
\leq \|v_1\|_{H^2_{\sigma y}} \|\theta_y u\|_{L^{\frac{2N}{N-2}}} \|A^\sigma (\theta_y u_1)\|_{L^{\frac{2N}{N-2}}} \\
\leq C \|v_1\|_{H^2_{\sigma y}} (\|\theta_y u\|_{L^2} + \|A^{1+\sigma} (\theta_y u)\|_{L^2}) (\|\theta_y u_1\|_{L^2} + \|A^{1+\sigma} (\theta_y u_1)\|_{L^2}) \\
\leq C_M C \|v_1\|_{H^2_{\sigma y}} (1 + \|A^{1+\sigma} (\theta_y u)\|_{L^2}^2 + \epsilon \|A^{1+\sigma} (\theta_y u_1)\|_{L^2}^2)
\]

(8.24)

\[
\leq C_M C \|v_1\|_{H^2_{\sigma y}} (1 + \|A^{1+\sigma} (\theta_y u)\|_{L^2}^2 + \epsilon (1 + \|A^{1+\sigma} (\theta_y u)\|_{L^2}^2 + \|A^{1+\sigma} (\theta_y u_1)\|_{L^2}^2),
\]

where \(C_M\) is a constant which depends on the \(H_0\)-bound of initial data (see Remark \[8.2\]). Similar to \[8.13\], we have

\[
\int_{\mathbb{R}^N} \theta_y |w_1|^{\frac{N+2}{N-2}} |u||A^\sigma (\theta_y u_1)| \\
\leq C \|w_1\|_{H^{1+\sigma}_{\sigma y}} \|\theta_y u\|_{L^p} \left( \|A^\sigma (\theta_y u_1)\|_{L^2} + \|A^{1+\sigma} (\theta_y u_1)\|_{L^2} \right) \\
\text{(8.25)}
\]

\[
\leq \frac{1}{8} \left( \int_{\mathbb{R}^N} |A^{1+\sigma} (\theta_y u)|^2 + \int_{\mathbb{R}^N} |A^{1+\sigma} (\theta_y u_1)|^2 \right) + CK_\epsilon (1 + \|\theta_y u\|_{L^2}^2 + \|\theta_y u_1\|_{L^2}^2) 
\]

where \(p = \frac{2N(N-2)}{(N-2)^2-2(N-6)} < \frac{2N}{N-2} \) and where we used interpolation inequality and \[8.2\].

Moreover,

\[
\int_{\mathbb{R}^N} \theta_y |u|^{\frac{N+2}{N-2}} |A^\sigma (\theta_y u)| \leq C_M C \|v_1\|_{H^2_{\sigma y}} (1 + \|A^{1+\sigma} (\theta_y u)\|_{L^2}^2) \\
\text{+ } \epsilon (1 + \|A^{1+\sigma} (\theta_y u)\|_{L^2}^2) + CK_\epsilon (1 + \|\theta_y u\|_{L^2}^2)
\]

(8.26)
Therefore, by taking $\epsilon$ small enough and noticing (7.24), we have
\[
\frac{d}{dt} \left( \|A^\tau (\theta_y u_\epsilon(t) + \theta_y u(t))\|_{L^2}^2 + 2\|A^{\frac{1+\nu}{2}} (\theta_y u(t))\|_{L^2}^2 \right)
+ \left( \frac{1}{2} - CM_{\kappa,\sigma} \|v_1(t)\|_{H^1_t}^2 \right) \left( \|A^\tau (\theta_y u_\epsilon(t) + \theta_y u(t))\|_{L^2}^2 + 2\|A^{\frac{1+\nu}{2}} (\theta_y u(t))\|_{L^2}^2 \right)
\leq C_{M,\kappa,\sigma} \left\| g \right\|_{L^2} \epsilon.
\]
Using the Gronwall inequality and integrating over $[0, t]$, we get that
\[
\|A^\tau (\theta_y u_\epsilon(t) + \theta_y u(t))\|_{L^2}^2 + 2\|A^{\frac{1+\nu}{2}} (\theta_y u(t))\|_{L^2}^2 \leq e^{-\int_0^t (\frac{1}{2} - CM_{\kappa,\sigma} \|v_1(s)\|_{H^1_t}^2) ds} \left( \|A^\tau (\theta_y u_\epsilon(0) + \theta_y u(0))\|_{L^2}^2 + 2\|A^{\frac{1+\nu}{2}} (\theta_y u(0))\|_{L^2}^2 \right)
\]
(8.28)
\[
+ C_{M,\kappa,\sigma} \left\| g \right\|_{L^2} \epsilon \int_0^t e^{-\int_0^\tau (\frac{1}{2} - CM_{\kappa,\sigma} \|v_1(\tau)\|_{H^1_t}^2) d\tau} ds.
\]
Then, we can complete the proof by the same calculation as that for (8.21), and we only need to note that $(u_\epsilon, v_\epsilon)$ now also belongs to $H_\sigma$.

In the following, based on Lemmas 8.3 and 8.4 above, we can perform the bootstrap arguments; their proofs are similar to those for Lemmas 8.3 and 8.4 (e.g., see [27, 29, 30] for the bounded domain case). We also remark that Lemma 8.4 makes $f$ become subcritical to some extent; consequently, the proofs of Lemmas 8.5 and 8.6 below are simpler than Lemmas 8.3 and 8.4.

**Lemma 8.5.** For each $\sigma \leq \kappa \leq 1$, assume $B_\kappa \subset B_1$ and $B_\kappa$ is bounded in $H_\kappa$. Then there exists a constant $M_\kappa$ which depends only on the $H_\kappa$-bound of $B_\kappa$ such that
\[
\|S(t)B_\kappa\|_{H_\kappa} \leq M_\kappa \quad \text{for all} \ t \geq 0.
\]

**Lemma 8.6.** For each $\kappa \in [\sigma, 1-\min\{\sigma, \frac{4\nu_1}{\nu_1+\nu_2}\}]$, if the initial data set $B_\kappa \subset B_1$ and $B_\kappa$ is bounded in $H_\kappa$, then the decomposed ingredient $(w(t), w_\epsilon(t))$ (the solutions of (6.5)) satisfies
\[
\|K(t)B_\kappa\|_{H_{\kappa+s}} \leq J_\kappa \quad \text{for all} \ t \geq 0,
\]
where the constant $J_\kappa$ depends only on the $H_\kappa$-bound of $B_\kappa$ and $s = \min\{\sigma, \frac{4\nu_1}{\nu_1+\nu_2}\}$.

9. **Proofs of the main results**

9.1. **Proof of Theorem 1.1** In this subsection, we mainly verify Theorem 1.1. We first recall the following attraction transitivity lemma:

**Lemma 9.1** ([17]). Let $K_1, K_2, K_3$ be subsets of $H$ such that
\[
\text{dist}_H(S(t)K_1, K_2) \leq L_1 e^{-\nu_1 t}, \quad \text{dist}_H(S(t)K_2, K_3) \leq L_2 e^{-\nu_2 t},
\]
for some $\nu_1, \nu_2 > 0$ and $L_1, L_2 > 0$. Assume also that for all $z_1, z_2 \in \bigcup_{j \geq 0} S(t)K_j$ ($j = 1, 2, 3$) there holds
\[
\|S(t)z_1 - S(t)z_2\| \leq L_0 e^{\nu_0 t} \|z_1 - z_2\|
\]
for some $\nu_0 > 0$ and some $L_0 \geq 0$. Then it follows that
\[
\text{dist}_H(S(t)K_1, K_3) \leq L e^{-\nu t},
\]
where $\nu = \frac{\nu_1 \nu_2}{\nu_0 + \nu_1 + \nu_2}$ and $L = L_0 L_1 + L_2$. 

License or copyright restrictions may apply to redistribution; see http://www.ams.org/journal-terms-of-use
Based on the above preliminary lemmas, we are now in the position to prove Theorem 1.1.

**Proof of Theorem 1.1.** For the set $B_1$ given in (7.1), from Lemma 8.3 and Lemma 7.3 we know that there is a set $A_\sigma$ which is bounded in $H_0$ such that 

\[ \text{dist}_{H_0}(S(t)B_1, A_\sigma) \leq \text{dist}_{H_0}(D(t)B_1, A_\sigma) \leq Q_1(\|B_1\|_{H_0})e^{-k_0 t}. \]

Applying Lemma 8.6 and Lemma 7.3 to $A_\sigma$, we see that there is a set $A_{\sigma+s}$ (given in Lemma 8.6) which is bounded in $H_{\sigma+s}$, such that 

\[ \text{dist}_{H_0}(S(t)A_{\sigma}, A_{\sigma+s}) \leq \text{dist}_{H_0}(D(t)A_\sigma, A_{\sigma+s}) \leq Q_1(\|A_\sigma\|_{H_0})e^{-k_0 t}, \]

where $k_0'$ depends on the $H_0$-bound of $A_\sigma$.

Combining this with Remark 9.2 we know that the conditions in Lemma 9.1 are all satisfied. Hence, we have 

\[ \text{dist}_{H_0}(S(t)B_1, A_{\sigma+s}) \leq CQ_1(\|B_1\|_{H_0})e^{-k_0' t}, \]

for two appropriate constants $C$ and $k_0''$.

Since $\sigma = \min \{ \frac{2}{\ell}, \frac{N-2}{4} \}$ and $s = \min \{ \sigma, \frac{4\sigma}{N-2} \}$ are fixed, by finite steps (e.g., at most by $\lceil \frac{1}{s} \rceil + 2$ steps) we can infer that there is a bounded (in $H_1$) set $B_1 \subset H_1$ such that 

\[ \text{dist}_{H_0}(S(t)B_1, B_1) \leq Q(\|B_1\|_{H_0})e^{-\nu t}. \]

Note further that all the constants in (9.1) depend only on $\|B_1\|_{H_0}$.

Now, for any bounded (in $H_0$) set $B$, from Theorem 1.1 and Lemma 4.2 we see that there is a $T_B$ such that 

\[ S(t)B \subset B_1 \quad \text{for all} \quad t \geq T_B. \]

Hence, 

\[ \text{dist}_{H_0}(S(t)B, B_1) \leq Me^{\nu T_B}e^{-\nu t}, \]

where $M = \sup \{ \|S(t)B\|_{H_0} \mid 0 \leq t \leq T_B \} < \infty$.

Finally, we apply the attraction transitivity lemma, i.e., Lemma 9.1 again to (9.1) and (9.2), and this completes the proof of Theorem 1.1. \qed

9.2. **Proof of Theorem 1.2.** In this subsection, we will prove one of our main results, Theorem 1.2. From Theorem 1.1 we know that $\{S(t)\}_{t \geq 0}$ has a bounded ($H_0, H^1_0 \times H^1_0$)-attracting set $B_1$ (given in Theorem 1.1); then we only need to verify the corresponding asymptotic compactness and continuity.

We first deduce some continuity of $S(t)$ with respect to the $H^1_0 \times H^1_0$-norm in the bounded absorbing set $B_1$ (given in (7.1)).

**Lemma 9.2** (Continuity w.r.t. the $H^1_0 \times H^1_0$-norm). Let $z^n_k = (u^n_k, v^n_k) \in B_1$, $n = 1, 2, \ldots$, be a convergent sequence with respect to the $H^1_0 \times L^2_0$-norm. Then for any $t \geq 0$, $S(t)z^n_k$ is also a convergent sequence with respect to the $H^1_0 \times H^1_0$-norm.

**Proof.** Let $(u^i(t), u^i_k(t))$ ($i = 1, 2$) be the corresponding solution to $(u^i_0, v^i_0) \in B_1$, and let $z(t) = u^1(t) - u^2(t)$. Then $z$ satisfies 

\[ z_{tt} + z_t - \Delta z_t - \Delta z + f(u^1(t)) - f(u^2(t)) = 0, \]

with the initial condition 

\[ (z(0), z_t(0)) = (u^1_0, v^1_0) - (u^2_0, v^2_0). \]
Multiplying (9.3) by \( \rho z_t \), and by some calculations as before, we have
\[
(9.4) \quad \int_{\mathbb{R}^N} \rho (|z_t(t)|^2 + |\nabla z(t)|^2) \leq C_M \int_{\mathbb{R}^N} \rho (|z_t(t)| + |\nabla z(t)|^2 + |z(t)|^2),
\]
where \( C_M \) only depends on the \( H^1_{\rho_i} \times L^2_{\rho_i} \)-bound of \( B_1 \). This, combined with the continuity of \( S(t) \) with respect to the \( H^1_{\rho} \times L^2_{\rho} \)-norm and the arbitrariness of \( (u_0^i, v_0^i) \), implies that \( S(t) \) is continuous in \( B_1 \) with respect to the \( H^1_{\rho} \times L^2_{\rho} \)-norm. \( \square \)

**Proof of Theorem 1.2.** We only need to verify the necessary \( (\mathcal{H}_0, H^1_{\rho} \times H^1_{\rho}) \)-asymptotic compactness. This is a direct corollary of the compactness of \( B_1 \) w.r.t. the \( H^1_{\rho} \times L^2_{\rho} \)-norm (by compact embedding) and the continuity (9.4). \( \square \)
