GREEN’S MATRICES OF SECOND ORDER ELLIPTIC SYSTEMS WITH MEASURABLE COEFFICIENTS IN TWO DIMENSIONAL DOMAINS

HONGJIE DONG AND SEICK KIM

Abstract. We study Green’s matrices for divergence form, second order strongly elliptic systems with bounded measurable coefficients in two dimensional domains. We establish existence, uniqueness, and pointwise estimates of Green’s matrices.

1. Introduction

In this article, we study Green’s matrices for divergence form, second order strongly elliptic systems with bounded measurable coefficients in two dimensional domains. More precisely, we are concerned with the Green’s matrix for elliptic systems

$$\sum_{j=1}^{N} L_{ij} u^j := \sum_{j=1}^{N} \sum_{\alpha,\beta=1}^{2} D_{\alpha}(A_{ij}^{\alpha\beta}(x)D_{\beta}u^j), \quad i = 1, \ldots, N,$$

in an open connected set $\Omega \subset \mathbb{R}^2$. Here, $A_{ij}^{\alpha\beta}(x)$ are bounded measurable functions on $\Omega$ satisfying the strong ellipticity condition.

By a Green’s matrix we mean an $N \times N$ matrix valued function $G(x, y) = (G_{ij}(x, y))_{i,j=1}^{N}$ defined on $\{(x, y) \in \Omega \times \Omega : x \neq y\}$ satisfying the following properties (see Theorem 2.12 below for a more precise statement):

$$\sum_{j=1}^{N} L_{ij} G_{jk}(\cdot, y) = -\delta_{ik}\delta_y(\cdot) \quad \forall y \in \Omega,$$

$$G_{ij}(\cdot, y) = 0 \quad \text{on} \quad \partial \Omega \quad \forall y \in \Omega,$$

where $\delta_{ik}$ is the Kronecker delta symbol and $\delta_y(\cdot)$ is the Dirac delta function with a unit mass at $y$. In the scalar case (i.e., when $N = 1$), the Green’s matrix becomes a real valued function and is usually called the Green’s function.

Reverts to public domain 28 years from publication
We prove that if Ω has either finite volume or finite width, then there exists a unique Green’s matrix in Ω; see Theorem 2.12. The same is true when Ω is a domain above a Lipschitz graph (e.g., Ω = \( \mathbb{R}^2 \)); see Theorem 2.21. We also establish growth properties of the Green’s matrices including logarithmic pointwise bounds. We emphasize that we do not require Ω to be bounded nor to have a regular boundary in Theorem 2.12. Compared to the result of Dolzmann and Müller [4], where Ω is assumed to be a bounded Lipschitz domain (in fact, their methods work whenever there exists an \( L^p \)-theory for the equation under consideration on the domain), our result is quite an improvement in this respect. Although there is no Green’s matrix for Ω = \( \mathbb{R}^2 \), there is a possible definition of a fundamental matrix in the entire plane. Such a construction was carried out by Kenig and Ni [12] in the scalar case and by Auscher, McIntosh, and Tchamitchian [1] in the systems setting. (In fact, Auscher et al. considered elliptic equations with complex coefficients in [1], but with appropriate changes their strategy carries over to more general elliptic systems.) For the completeness of presentation, we include the result of Auscher et al. [1] in Section 5.

Let us briefly review the history of works in this area. In the scalar case, the basic facts about Green’s functions of symmetric elliptic operators in bounded domains were proved by Littman, Stampacchia, and Weinberger [16]. The study of the Green’s functions for nonsymmetric elliptic operators in bounded domains \( \Omega \subset \mathbb{R}^n \) (\( n \geq 3 \)) was carried out by Gruter and Widman [9]. As it was mentioned earlier, there is no Green’s function for \( \Omega = \mathbb{R}^2 \); the fundamental solution \(-\frac{1}{2\pi} \ln |x-y|\) of the Laplace equation changes sign and is not considered a Green’s function from a point of view of classical potential theory (see, e.g., [3]). Nevertheless, it is still possible to define a fundamental solution in \( \mathbb{R}^2 \). By using the maximum principle, Kenig and Ni [12] constructed one for symmetric elliptic operators. In [2], Chanillo and Li derived that the fundamental solution constructed by Kenig and Ni is a function of bounded mean oscillation in \( \mathbb{R}^2 \). Also, we would like to bring the reader’s attention to a paper by Escauriaza [6] on the fundamental solutions of elliptic and parabolic equations in nondivergence form. In the systems setting, the Green’s matrices of the elliptic systems with continuous coefficients in bounded \( C^1 \) domains have been discussed by Fuchs [7] and Dolzmann and Müller [4]. In fact, Dolzmann and Müller improved the strategy of Fuchs and showed the existence and pointwise estimate for Green’s matrix in bounded Lipschitz domains \( \Omega \subset \mathbb{R}^2 \) without imposing any regularity on the coefficients (their methods work whenever an \( L^p \) theory is available for the domain \( \Omega \)). Recently, Hofmann and Kim [10] gave a unified approach in studying Green’s functions/matrices in arbitrary domains \( \Omega \subset \mathbb{R}^n \) (\( n \geq 3 \)) valid for both scalar equations and systems of elliptic type by considering a class of operators \( L \) such that weak solutions of \( Lu = 0 \) satisfy an interior Hölder estimate. However, like the method used in Gruter and Widman [9], the method of Hofmann and Kim relied heavily on the assumption that \( n \geq 3 \) and could not be applied to the two dimensional case. A parabolic extension of the result by Hofmann and Kim was carried out in a very recent paper by Cho, Dong, and Kim [8]. In particular, Cho et al. proved that the so-called “Dirichlet heat kernel” of a strongly elliptic system exists in any domain \( \Omega \subset \mathbb{R}^2 \) (see Corollary 2.9 in [8]). In fact, our basic strategy is to make use of their result and construct the Green’s matrix out of the “Dirichlet heat kernel” by integrating in a \( t \)-variable.

The organization of this paper is as follows. In Section 2 we introduce some notation and then state our main results, Theorem 2.12 and Theorem 2.21. We
give the proof of Theorem 2.12 in Section 3 and that of Theorem 2.21 in Section 4. Finally, in Section 5 we introduce the result of Auscher et al. [1] regarding construction of a fundamental matrix for an elliptic system in the entire plane.

2. Preliminaries and main results

2.1. Strongly elliptic systems in \( \mathbb{R}^2 \). Throughout this article, the summation convention over repeated indices shall be assumed. Let \( L \) be a second order elliptic operator of divergence type acting on vector valued functions \( u = (u^1, \ldots, u^N)^T \) (\( N \geq 1 \)) defined on an open set \( \Omega \subset \mathbb{R}^2 \) in the following way:

\[
L u = D_\alpha (A^{\alpha \beta} D_\beta u) := \sum_{\alpha=1}^{2} \sum_{\beta=1}^{2} D_\alpha (A^{\alpha \beta} D_\beta u),
\]

where \( A^{\alpha \beta} = A^{\alpha \beta}(x) \) (\( \alpha, \beta = 1, 2 \)) are \( N \) by \( N \) matrices satisfying the strong ellipticity condition; i.e., there is a number \( \lambda > 0 \) such that

\[
A^{\alpha \beta}_{ij}(x)\xi_j \xi_i \geq \lambda |\xi|^2 := \lambda \sum_{i=1}^{N} \sum_{\alpha=1}^{2} |\xi^i_{\alpha}|^2 \quad \forall x \in \Omega.
\]

We also assume that \( A^{\alpha \beta}_{ij} \) are bounded; i.e., there is a number \( \Lambda > 0 \) such that

\[
\sum_{i,j=1}^{N} \sum_{\alpha,\beta=1}^{2} |A^{\alpha \beta}_{ij}(x)|^2 \leq \Lambda^2 \quad \forall x \in \Omega.
\]

We do not impose any further condition other than (2.2) and (2.3) on the coefficients. Especially, we do not assume the symmetry of the coefficients. The transpose operator \( ^tL \) of \( L \) is defined by

\[
^tL u = D_\alpha (^tA^{\alpha \beta} D_\beta u),
\]

where \( ^tA^{\alpha \beta} = (A^{\beta \alpha})^T \) (i.e., \( ^tA^{\alpha \beta}_{ij} = A^{\beta \alpha}_{ji} \)). Note that the coefficients \( ^tA^{\alpha \beta}_{ij} \) satisfy the conditions (2.2), (2.3) with the same constants \( \lambda, \Lambda \).

2.2. The function space \( Y^{1,2}_0(\Omega) \). The function space \( Y^{1,2}_0(\Omega) \) is defined as the set of all weakly differentiable functions on \( \Omega \) such that \( Du \in L^2(\Omega) \) and \( u_\eta \in W^{1,2}_0(\Omega) \) for any \( \eta \in C_c^\infty(\mathbb{R}^2) \). An open set \( \Omega \subset \mathbb{R}^2 \) is said to be a Green domain if \( \{u_\Omega : u \in C_c^\infty(\mathbb{R}^2)\} \not\subset W^{1,2}_0(\Omega) \). We ask the readers to refer to [17 §1.3.4] for the proofs of lemmas stated below.

Lemma 2.5. Let \( \Omega \subset \mathbb{R}^2 \) be a Green domain and \( B \subset \mathbb{R}^2 \) be a ball. Then, there is a constant \( C = C(\Omega, B) \) such that

\[
\|u\|_{L^2(\Omega \cap B)} \leq C \|Du\|_{L^2(\Omega)} \quad \forall u \in Y^{1,2}_0(\Omega).
\]

Lemma 2.7. Let \( \Omega \subset \mathbb{R}^2 \) be a Green domain. Then \( Y^{1,2}_0(\Omega) \) is a Hilbert space when endowed with the inner product

\[
\langle u, v \rangle := \int_\Omega D_\alpha u D_\alpha v.
\]
Lemma 2.9. Let \( \Omega \subset \mathbb{R}^2 \) be a Green domain. Then \( C^\infty_c(\Omega) \) is a dense subset of the Hilbert space \( Y_{0}^{1,2}(\Omega) \) equipped with the inner product \((2.8)\).

For a given function \( f = (f^1, \ldots, f^N)^T \in L^1_{\text{loc}}(\Omega)^N \), we shall say that \( u = (u^1, \ldots, u^N)^T \) is a weak solution in \( Y_{0}^{1,2}(\Omega)^N \) of \( Lu = -f \) if \( u \in Y_{0}^{1,2}(\Omega)^N \) and
\[
(2.10) \quad \int_{\Omega} A^{\alpha\beta}_{ij} D^i u^j D_\alpha \phi^i = \int_{\Omega} f^i \phi^i \quad \forall \phi \in C^\infty_c(\Omega)^N.
\]

It is routine to check that if \( \Omega \) is a Green domain and \( u \) is a weak solution in \( Y_{0}^{1,2}(\Omega)^N \) of \( Lu = 0 \), then \( u \equiv 0 \). Therefore, a weak solution in \( Y_{0}^{1,2}(\Omega)^N \) of \( Lu = -f \) is unique.

2.3. Main results. Let us state our main results. First, we consider domains with either finite volume or finite width. We shall denote by \( |\Omega| \) the Lebesgue measure of \( \Omega \) and by \( \delta(\Omega) \) the width of \( \Omega \subset \mathbb{R}^2 \); more precisely, we define
\[
(2.11) \quad \delta(\Omega) := \inf \{ \text{dist}(\ell_1, \ell_2) : \Omega \text{ lies between two parallel lines } \ell_1, \ell_2 \} \quad \inf \emptyset = \infty.
\]

Theorem 2.12. Let the operator \( L \) satisfy the conditions \((2.2)\) and \((2.3)\). Assume that \( \Omega \subset \mathbb{R}^2 \) is an open connected set with either finite volume or finite width so that
\[
(2.13) \quad \gamma = \gamma(\Omega) := \max \left( |\Omega|^{-1}, \delta(\Omega)^{-2} \right) > 0.
\]

Then, there exists a Green's matrix \( G(x, y) = (G_{ij}(x, y))_{i,j=1}^N \) defined on \( \{(x, y) \in \Omega \times \Omega : x \neq y\} \) satisfying the properties that
\[
(2.14) \quad \int_{\Omega} A^{\alpha\beta}_{ij} D^i G_{jk}(\cdot, y) D_\alpha \phi^j = \phi^k(y) \quad \forall \phi \in C^\infty_c(\Omega)^N
\]

and that for all \( \eta \in C^\infty_c(\Omega) \) satisfying \( \eta \equiv 1 \) on \( B_r(y) \) for some \( r < d_y \),
\[
(2.15) \quad (1 - \eta)G(\cdot, y) \in Y_{0}^{1,2}(\Omega)^N \times N.
\]

The Green's matrix \( G(x, y) \) in \( \Omega \) is unique in the following sense:

(a) \( G(x, y) \) is continuous in \( \{(x, y) \in \Omega \times \Omega : x \neq y\} \).

(b) \( G(x, \cdot) \) is locally integrable for all \( x \in \Omega \).

(c) For any \( f = (f^1, \ldots, f^N)^T \in C^\infty_c(\Omega)^N \), the function \( u = (u^1, \ldots, u^N)^T \) given by
\[
(2.16) \quad u(x) := \int_{\Omega} G(x, y)f(y) \, dy \quad \text{(i.e., } u^i(x) := \int_{\Omega} G_{ij}(x, y)f^j(y) \, dy \text{)}
\]
is a unique weak solution in \( Y_{0}^{1,2}(\Omega)^N \) of \( Lu = -f \).

Moreover, \( G(x, y) \) satisfies the following pointwise estimate:
\[
(2.17) \quad |G(x, y)| \leq C \left( \frac{1}{\sqrt{R^2 + \ln \frac{R}{|x-y|}}} \right) \quad \text{if } |x-y| < R := \frac{1}{2} \max(d_x, d_y),
\]

where \( d_x := \text{dist}(x, \partial \Omega) \) and \( C = C(\lambda, \Lambda, N) < \infty \). Consequently, \( G(\cdot, y) \) and \( G(x, \cdot) \) belong to \( L^p(B_r(y) \cap \Omega) \) and \( L^p(B_r(x) \cap \Omega) \), respectively, for all \( r > 0 \) and \( p \in [1, \infty) \).

Furthermore, \( DG(\cdot, y) \) and \( DG(x, \cdot) \) belong to \( L^p(B_r(y) \cap \Omega) \) and \( L^p(B_r(x) \cap \Omega) \), respectively, for all \( r > 0 \) and \( p \in [1, 2] \). Finally, we have the following symmetry:
\[
(2.18) \quad G(y, x) = ^tG(x, y)^T \quad \text{(i.e., } G_{ij}(y, x) = ^tG_{ji}(x, y)),
\]

where \( ^tG(x, y) \) is the Green's matrix of the transpose operator \( ^tL \) in \( \Omega \)}.
Remark 2.19. When $|\Omega| < \infty$, we have global $L^p$ estimates for the Green’s matrix and its derivatives. In that case, it will be evident from the proof of Theorem 2.12 that $G(\cdot, y)$ and $G(x, \cdot)$ belong to $L^p(\Omega)$ for all $p \in [1, \infty)$ and that $DG(\cdot, y)$ and $DG(x, \cdot)$ belong to $L^p(\Omega)$ for all $p \in [1, 2)$.

Next, we consider a domain above a Lipschitz graph. Let $\Omega$ be given by

\[(2.20) \quad \Omega = \{(x_1, x_2) \in \mathbb{R}^2 : x_2 > \varphi(x_1)\},\]

where $\varphi : \mathbb{R} \to \mathbb{R}$ is a Lipschitz function with a Lipschitz constant $M := ||\varphi'||_\infty < \infty$.

Theorem 2.21. Let the operator $L$ satisfy the conditions \[(2.22)\] and \[(2.3)\]. Assume that $\Omega$ is given by \[(2.20)\]. Then, there exists a unique Green's matrix $G(x, y)$ satisfying all the properties of Theorem 2.12 except \[(2.21)\]. Instead of \[(2.21)\] from Theorem 2.12 we have

\[(2.22) \quad |G(x, y)| \leq C \min \left\{1 + \ln_+(d_{x,y}/|x-y|), \frac{d_{x,y}^\mu}{|x-y|^{-\mu}}\right\} \quad \forall x, y \in \Omega, \quad x \neq y,\]

where $d_{x,y} := \min(d_x, d_y)$, $d_x := \text{dist}(x, \partial \Omega)$, $\ln_+ t := \max(\ln t, 0)$, $C = C(\lambda, \Lambda, N, M) < \infty$, and $\mu = \mu(\lambda, \Lambda, M) \in (0, 1)$. In particular, \[(2.22)\] implies $G(x, y) \to 0$ as $|x - y| \to \infty$.

3. Proof of Theorem 2.12

Throughout this section, we employ the letter $C$ to denote a constant depending on $\lambda, \Lambda, N$ while we use $C(\alpha, \beta, \ldots)$ to denote a constant depending on quantities $\alpha, \beta, \ldots$, as well as $\lambda, \Lambda, N$. It should be understood that $C$ may vary from line to line.

Let us recall the following version of Poincaré inequality (see, e.g., [8] for the proof).

Lemma 3.1. If $\Omega \subset \mathbb{R}^2$ is an open connected set with either finite volume or finite width, let $\gamma$ be given as in \[(2.13)\] of Theorem 2.12. Then

\[(3.2) \quad ||u||_{L^2(\Omega)} \leq (2\gamma)^{-1/2} ||Du||_{L^2(\Omega)} \quad \forall u \in W^{1,2}_0(\Omega).\]

By using the above lemma, one can show that if $\Omega$ has either finite volume or finite width, then $\Omega$ is a Green domain and $Y^{1,2}_0(\Omega)$ is a space $W^{1,2}_0(\Omega)$ (see, e.g., [17] §1.3.4). In the rest of this section we shall identify $Y^{1,2}_0(\Omega)$ with $W^{1,2}_0(\Omega)$.

3.1. Construction of the Green’s matrix. Let $\Gamma(t, x, s, y) (x, y \in \Omega$ and $t, s \in \mathbb{R}$) be the parabolic Green’s matrix given as in [8, Corollary 2.9]. Note that we have $\Gamma(t, x, x, y) \neq \Gamma(t - s, x, 0, y)$. Throughout the paper, we shall denote

\[(3.3) \quad K(t, x, y) := \Gamma(t, x, 0, y),\]

\[(3.4) \quad \dot{K}(t, x, y) := \int_0^t K(s, x, y) \, ds.\]
Here we record some properties of $K(t, x, y)$ ($x, y \in \Omega$ and $t \in \mathbb{R}$) derived in [3 Corollary 2.9] for the reference. Recall that $d_x := \text{dist}(x, \partial \Omega)$ for $x \in \Omega$.

$$(3.5) \quad \sup_{t \in (r^2, \infty)} \int_{\Omega} |K(t, x, y)|^2 \, dx \leq Cr^{-2} \quad \forall y \in \Omega \quad \forall r < d_y,$$

$$(3.6) \quad \int_{(0, \infty) \times \Omega \setminus (0, r^2) \times B_r(y)} |K(t, x, y)|^4 \, dx \, dt \leq Cr^{-4} \quad \forall y \in \Omega \quad \forall r < d_y,$$

$$(3.7) \quad \int_{(0, \infty) \times \Omega \setminus (0, r^2) \times B_r(y)} |D_x K(t, x, y)|^2 \, dx \, dt \leq Cr^{-2} \quad \forall y \in \Omega \quad \forall r < d_y,$$

$$(3.8) \quad \int_{(0, r^2) \times B_r(y)} |K(t, x, y)|^p \, dx \, dt \leq C (p) r^{-2p+4} \quad \forall y \in \Omega \quad \forall r < d_y \quad \forall p \in [1, 2),$$

$$(3.9) \quad \int_{(0, r^2) \times B_r(y)} |D_x K(t, x, y)|^p \, dx \, dt \leq C (p) r^{-3p+4} \quad \forall y \in \Omega \quad \forall r < d_y \quad \forall p \in [1, 4/3),$$

$$(3.10) \quad |K(t, x, y)| \leq C \left\{ \max \left( \sqrt{|t|}, |x - y| \right) \right\}^{-2} \quad \text{if} \quad 0 < \max \left( \sqrt{|t|}, |x - y| \right) < \frac{1}{2} \max(d_x, d_y).$$

We define the Green’s matrix $G(x, y)$ as follows:

$$(3.11) \quad G(x, y) := \lim_{t \to \infty} \tilde{K}(t, x, y) = \int_{0}^{\infty} K(s, x, y) \, ds \quad \forall x, y \in \Omega, \quad x \neq y.$$ 

The next lemma will show that $G(x, y)$ is well defined.

**Lemma 3.12.** For any $x, y \in \Omega$ with $x \neq y$, we have $\int_{0}^{\infty} |K(s, x, y)| \, ds < \infty$.

**Proof.** By [3] Theorem 2.7, we know that $t \mapsto K(t, x, y)$ is continuous in $t \in \mathbb{R}$ for $x \neq y$. Therefore, we only need to show that $\int_{0}^{\infty} |K(t, x, y)| \, dt < \infty$ for some $a > 0$. Let $u$ be the $k$-th column of $K(\cdot, \cdot, y)$. Then, by the local boundedness estimate (see [13])

$$(3.13) \quad |u(t, x)| \leq C \left( \int_{t - \rho^2}^{t} \int_{B_{\rho}(x)} |u(s, y)|^2 \, dy \, ds \right)^{1/2} \quad \forall t > \rho^2 \quad \forall \rho < d_x.$$ 

By (3.2) of Lemma 3.1 $I(t) := \int_{\Omega} |u(t, \cdot)|^2$ satisfies

$$I'(t) = -2 \int_{\Omega} A_{ij} \partial_{ij} u |D_{\alpha} u|^2 \leq -2\lambda \int_{\Omega} |D u(t, \cdot)|^2 \leq -4\lambda I(t) \quad \forall t > 0.$$ 

Therefore, by using (3.3) we obtain

$$(3.14) \quad \int_{\Omega} |K(t, \cdot, y)|^2 \leq Ce^{-4\lambda\gamma(t-r^2)}r^{-2} \quad \forall t > r^2 \quad \forall r < d_y.$$ 

By combining (3.13) and (3.14) we have

$$(3.15) \quad |K(t, x, y)| \leq Ae^{-2\lambda\gamma t} \quad \forall t > a,$$

where $A = A(d_x, d_y) < \infty$ and $a = a(d_x, d_y) < \infty$. The lemma is proved. \qed
Next, we show that $G(\cdot, y)$ is continuous in $\Omega \setminus \{y\}$ for any $y \in \Omega$. We need the following lemma, the proof of which can be found in [13, Theorem 3.3] (cf. (2.20) and (2.21) in [3]).

**Lemma 3.16.** Let $L$ satisfy (2.22) and (2.23). If $u(t, x)$ is a weak solution of $u_t - Lu = 0$ in $Q_{2r}^y := Q_{2r}((t_0, x_0)) := (t_0 - 4r^2, t_0) \times B_{2r}(x_0)$, then for all $x, x' \in B_r(x_0)$ and $t \in (t_0 - r^2, t_0)$,

$$|u(x, t) - u(x', t)| \leq C|x - x'|^{\mu r^{-1}(1 + \mu)} \|D_x u\|_{L^2(Q_{2r}^y)},$$

$$|u(x, t) - u(x', t)| \leq C|x - x'|^{\mu r^{-2}(2 + \mu)} \|u\|_{L^2(Q_{2r}^y)},$$

where $\mu = \mu(\lambda, \Lambda) \in (0, 1)$.

Let $u(t, x)$ be the $k$-th column of $K(t, x, y)$. Fix $x_0 \in \Omega$ with $x_0 \neq y$ and choose $r > 0$ such that $r < d_y$ and $B_{2r}(x_0) \subset \Omega \setminus B_r(y)$. By [3, Theorem 2.7] and (3.3), we find that $u(t, x)$ is a weak solution of $u_t - Lu = 0$ in $Q_{2r}((t_0, x_0))$ for any $t_0 \in \mathbb{R}$. Therefore, by using Lemma 3.10, 3.3, 4.7, and 3.14 we have (recall that $K(t, x, y) \equiv 0$ for $t < 0$)

$$|K(t, x, y) - K(t, x_0, y)| \leq C|x - x_0|^{\mu r^{-(2 + \mu)}} \quad \forall x \in B_r(x_0) \quad \forall t \in \mathbb{R},$$

$$|K(t, x, y) - K(t, x_0, y)| \leq C|x - x_0|^{\mu r^{-(2 + \mu)} e^{-2\lambda(\gamma - t^2)}} \quad \forall x \in B_r(x_0) \quad \forall t > 5r^2.$$

Then, for any $x \in B_r(x_0)$, we have

$$|G(x, y) - G(x_0, y)| \leq \int_0^{5r^2} |K(t, x, y) - K(t, x_0, y)| \, dt$$

$$+ \int_{5r^2}^{\infty} |K(t, x, y) - K(t, x_0, y)| \, dt$$

$$\leq C|x - x_0|^{\mu r^{-(1 + r^{-2} \gamma^{-1})}}.$$
Lemma 3.23. The following estimates hold uniformly for all $t > 0$ and for all $y \in \Omega$:

\begin{align}
(3.24) & \quad \|\tilde{\mathbf{K}}(t, \cdot, y)\|_{L^p(B_r(y))} \leq C(p) \gamma^{-1} r^{2/p-2} \quad \forall p \in [1, 2), \quad \text{where } \rho = d_y, \\
(3.25) & \quad \|\tilde{\mathbf{K}}(t, \cdot, y)\|_{L^1(B_r(y))} \leq C \gamma^{-1} r^{-3/2} \quad \forall r \leq d_y, \\
(3.26) & \quad \|\tilde{D}\tilde{\mathbf{K}}(t, \cdot, y)\|_{L^p(B_r(y))} \leq C(p) \gamma^{-1} r^{2/p-3} \quad \forall p \in [1, 4/3), \quad \text{where } \rho = d_y, \\
(3.27) & \quad \|\tilde{D}\tilde{\mathbf{K}}(t, \cdot, y)\|_{L^2(\Omega \setminus B_r(y))} \leq C \gamma^{-1} r^{-2} \quad \forall r \leq d_y.
\end{align}

Proof. We begin by proving (3.24). Fix $p \in [1, 2)$. By Minkowski’s inequality, we have

\begin{align}
(3.28) & \quad \int_{B_r(y)} |\tilde{\mathbf{K}}(t, x, y)|^p \, dx \leq \int_0^t \left( \int_{B_r(y)} |\mathbf{K}(s, x, y)|^p \, dx \right)^{1/p} \, ds \\
& \quad \leq \int_0^{\rho^2} + \int_{\rho^2}^{\infty} \left( \int_{B_r(y)} |\mathbf{K}(s, x, y)|^p \, dx \right)^{1/p} \, ds := I_1 + I_2.
\end{align}

We estimate $I_1$ by using Hölder’s inequality and [3.14] as follows:

\begin{align}
(3.29) & \quad I_1 \leq \left( \int_0^{\rho^2} \int_{B_r(y)} |\mathbf{K}(s, x, y)|^p \, dx \, ds \right)^{1/p} \rho^{2(1-1/p)} \leq C(p) \rho^{2/p}.
\end{align}

To estimate $I_2$, observe that Hölder’s inequality and [3.14] yield (recall $1 \leq p < 2$)

\begin{align}
(3.30) & \quad \int_{B_r(y)} |\mathbf{K}(s, x, y)|^p \, dx \leq \left( \int_{B_r(y)} |\mathbf{K}(s, x, y)|^2 \, dx \right)^{1/2} |B_r(y)|^{1/p-1/2} \\
& \quad \leq C(p) \rho^{2/p-2} e^{-2\gamma(s-r^2)} \forall s > \rho^2.
\end{align}

Therefore, we obtain

\begin{align}
(3.31) & \quad I_2 \leq C(p) \rho^{2/p-2} \int_{\rho^2}^{\infty} e^{-2\gamma(s-r^2)} \, ds \leq C(p) \rho^{2/p-2} \gamma^{-1}.
\end{align}

Since $1 \leq \rho^{-2} \gamma^{-1}$ in any case, we obtain [3.24] by combining (3.29) and (3.30).

Next, we prove (3.25). By using Minkowski’s inequality as in (3.28), we have

\begin{align}
(3.32) & \quad \left( \int_{\Omega \setminus B_r(y)} |\tilde{\mathbf{K}}(t, x, y)|^4 \, dx \right)^{1/4} \leq \int_0^{\rho^2} + \int_{\rho^2}^{\infty} \left( \int_{\Omega \setminus B_r(y)} |\mathbf{K}(s, x, y)|^4 \, dx \right)^{1/4} \, ds \\
& \quad := I_3 + I_4.
\end{align}

By proceeding as in (3.29) but using [3.6] instead, we obtain

\begin{align}
(3.33) & \quad I_3 \leq \left( \int_0^{\rho^2} \int_{\Omega \setminus B_r(y)} |\mathbf{K}(s, x, y)|^4 \, dx \, ds \right)^{1/4} \rho^{2(1-1/4)} \leq C \rho^{1/2}.
\end{align}
By a well known embedding theorem (see, e.g., [14, §II.3] or [15, Theorem 6.9]), the energy inequality, and (3.14), we have for \( t > r^2 \)
\[
\int_t^\infty \int_\Omega |K(s, x, y)|^4 \, dx \, ds \leq C \left( \sup_{t \leq s} \int_\Omega |K(s, x, y)|^2 \, dx \right) \int_t^\infty \int_\Omega |D_x K(s, x, y)|^2 \, dx \, ds
\]
(3.32)
\[
\leq C \left( \int_\Omega |K(t, x, y)|^2 \, dx \right)^2 \leq Cr^{-4} e^{-8\lambda\gamma(t-r^2)}.
\]

Then, by using Hölder’s inequality and (3.32) we estimate
\[
I_4 \leq \sum_{j=1}^\infty \left( \int_{j\rho^2}^{(j+1)\rho^2} \int_\Omega |K(s, x, y)|^4 \, dx \, ds \right)^{1/4} r^{3/2} \leq Cr^{1/2} \sum_{j=1}^\infty e^{-2\lambda\gamma(j-1)r^2}
\]
(3.33)
\[
\leq Cr^{1/2} (1 + r^{-2}\gamma^{-1}).
\]

By combining (3.31) and (3.33), we get (3.25).

We now turn to the proof of (3.26). Fix \( p \in [1, 4/3) \). As in (3.28), we have
\[
\left( \int_{B_\rho(y)} |D_x \tilde{K}(t, x, y)|^p \, dx \right)^{1/p} \leq \int_{\rho^2}^{2\rho^2} \left( \int_{B_\rho(y)} |D_x K(s, x, y)|^p \, dx \right)^{1/p} ds := I_5 + I_6.
\]

By Hölder’s inequality and (3.9), we find
(3.34)
\[
I_5 \leq \left( \int_0^{\rho^2} \int_{B_\rho(y)} |D_x K(s, x, y)|^p \, dx \, ds \right)^{1/p} \rho^{2(1-1/p)} \leq C(p) \rho^{-1+2/p}.
\]

To estimate \( I_6 \), note that Hölder’s inequality implies (recall \( 1 \leq p < 4/3 \))
(3.35)
\[
\left( \int_{B_\rho(y)} |D_x K(s, x, y)|^p \right)^{1/p} \leq \left( \int_{B_\rho(y)} |D_x K(s, x, y)|^2 \right)^{1/2} |B_\rho(y)|^{1/p-1/2}.
\]

As in (3.32), the energy inequality and (3.14) yield
(3.36)
\[
\int_t^\infty \int_\Omega |D_x K(s, x, y)|^2 \, dx \, ds \leq C \rho^{-2} e^{-4\lambda\gamma(t-\rho^2)} \quad \forall t > \rho^2.
\]

Then, as in (3.33), we estimate \( I_6 \) by combining (3.35) and (3.36):
(3.37)
\[
I_6 \leq C(p) \rho^{2/p} \sum_{j=1}^\infty \left( \int_{j\rho^2}^{(j+1)\rho^2} \int_\Omega |D_x K(s, x, y)|^2 \, dx \, ds \right)^{1/2} \leq C(p) \rho^{2/p-1} (1 + \rho^{-2}\gamma^{-1}).
\]

We obtain (3.26) by adding (3.34) and (3.37).
Finally, we prove (3.27). By using Minkowski’s inequality again, we have
\[
\left( \int_{\Omega \setminus B_r(y)} |D_x \tilde{K}(t, x, y)|^2 \, dx \right)^{1/2} \leq \int_0^r \left( \int_{\Omega \setminus B_r(y)} |D_x K(s, x, y)|^2 \, dx \right)^{1/2} \, ds := I_7 + I_8.
\]

We estimate \(I_7\) by using Hölder’s inequality and (3.7):
\[
I_7 \leq \left( \int_0^r \left( \int_{\Omega \setminus B_r(y)} |D_x K(s, x, y)|^2 \, dx \right)^{1/2} \, ds \right)^2 \leq C.
\]

Also, by using (3.36) and proceeding as in (3.37), we obtain
\[
I_8 \leq \frac{r}{\gamma} \sum_{j=1}^{\infty} \left( \int_{j^2}^{(j+1)^2} \left( \int_{\Omega \setminus B_r(y)} |D_x K(s, x, y)|^2 \, dx \right)^{1/2} \, ds \right)^2 \leq C(1 + r^{-2 \gamma - 1}).
\]

Therefore, (3.27) follows from (3.38) and (3.39). The lemma is proved.

Fix \(p_0 \in (1, 2)\) and \(r \leq d_y\). By (3.11) and (3.24), there exists a sequence \(\{t_m\}_{m=1}^{\infty}\) tending to infinity such that \(\tilde{K}(t_m, \cdot, y) \rightharpoonup G(\cdot, y)\) weakly in \(L^{p_0}(B_r(y))\), and thus we have
\[\|G(\cdot, y)\|_{L^{p_0}(B_r(y))} \leq C(p_0, \gamma, d_y, r) < \infty \quad \forall r \leq d_y.\]

By a similar reasoning, (3.25) yields that
\[\|G(\cdot, y)\|_{L^4(\Omega \setminus B_r(y))} \leq C(1 + r^{-3/2} \gamma) \quad \forall r \in (0, d_y].\]

The above inequalities together with (2.18) imply that \(G(\cdot, \cdot)\) is locally integrable for any \(x \in \Omega\). Therefore, the integral in (2.16) is absolutely convergent for any \(f \in C_c^\infty(\Omega)\), and thus \(u\) is well defined in (2.16). Moreover, (3.24) and (3.25) together with (3.22) imply
\[
v(t, x) := \int_{\Omega} \tilde{K}(t, x, y) f(y) \, dy
\]
is well defined. By the dominated convergence theorem, we also find that
\[
\lim_{t \to \infty} v(t, x) = \int_{\Omega} G(x, y) f(y) \, dy = u(x).
\]

Also, by the definition of \(\tilde{K}(t, x, y)\) in (3.4), it is easy to verify
\[
v_t(t, x) = \int_{\Omega} K(t, x, y) f(y) \, dy \quad \forall t > 0.
\]

Then, as in the proof of Lemma 3.12, we have
\[
\|v_t(t, \cdot)\|_{L^2(\Omega)}^2 \leq C e^{-4 \lambda t} \|f\|_{L^2(\Omega)}^2 \quad \forall t > 0.
\]

We need the following lemma to show that \(u\) is a weak solution in \(W^{1,2}_0(\Omega)^N\) of \(Lu = -f\). The readers are asked to consult [3] or [14] for the definition of \(\dot{V}^{1,0}_2((0, T) \times \Omega)\), etc.
Lemma 3.44. For all $T > 0$, the function $v$ defined in (3.40) is the unique weak solution in $\tilde{V}^{2,0}_2((0, T) \times \Omega)^N$ of the problem

$$v_t - L v = f, \quad v = 0 \text{ on } (0, T) \times \partial \Omega, \quad v(0, \cdot) = 0.$$  

Proof. Let $w$ be the weak solution in $\tilde{V}^{2,0}_2((0, T) \times \Omega)^N$ of the problem (3.45), the existence and uniqueness of which can be found in [14]. We only need to show that $v \equiv w$ in $\Omega \times (0, T)$. Fix $t \in (0, T)$ and $x \in \Omega$. Let $\Gamma(s, y, t, x)$ be the parabolic Green's matrix of $\mathcal{L} := -\partial_t - L$ constructed as in [3]. Then, by proceeding similarly as in the proof of [3] Theorem 2.7, we obtain (cf. [3] Lemma 3.1)

$$w^{k}(t, x) = \int^{T}_{0} \int_{\Omega} \Gamma_{ik}(s, y, t, x)f^{i}(y) \, dy \, ds = \int^{T}_{0} \int_{\Omega} \Gamma_{ki}(t, x, s, y)f^{i}(y) \, dy \, ds$$

$$= \int^{T}_{0} \int_{\Omega} K_{ki}(t - s, x, y)f^{i}(y) \, dy \, ds = \int^{T}_{0} \int_{\Omega} K_{ki}(s, x, y)f^{i}(y) \, dy \, ds = v^{k}(t, x),$$

where we have used $K(t, x, y) \equiv 0$ for $t < 0$. The lemma is proved. \qed

Note that (3.43) particularly implies $v_{i}(t, \cdot) \in L^{2}(\Omega)^N$, and thus it is not hard to verify

$$\int_{\Omega} v_{i}^{2}(t, \cdot) \phi_{j} + \int_{\Omega} A_{ij}^{\alpha \beta} Dv^{\alpha}(t, \cdot)D_{\alpha}\phi_{j} = \int_{\Omega} f_{i}(\cdot) \forall \phi \in W^{1, 2}_{0}(\Omega)^N \forall t > 0.$$  

Then, by setting $\phi = v(t, \cdot)$ above, we find that for almost all $t > 0,$

$$\lambda \|Dv(t, \cdot)\|_{L^{2}(\Omega)}^{2} \leq (\|f\|_{L^{2}(\Omega)} + \|v_{i}(t, \cdot)\|_{L^{2}(\Omega)})\|v(t, \cdot)\|_{L^{2}(\Omega)}$$

$$\leq C\gamma^{-1/2}\|f\|_{L^{2}(\Omega)}\|Dv(t, \cdot)\|_{L^{2}(\Omega)},$$

where we have used (3.43) and Lemma 3.1. Therefore, for almost all $t > 0,$

$$\|Dv(t, \cdot)\|_{L^{2}(\Omega)} \leq C\gamma^{-1/2}\|f\|_{L^{2}(\Omega)}.$$  

Then, by the weak compactness and (3.41), we find that there exists an increasing sequence $\{t_{m}\}_{m=1}^{\infty}$ tending to infinity such that

$$\lim_{m \to \infty} \int_{\Omega} A_{ij}^{\alpha \beta} Dv^{\alpha}(t_{m}, \cdot)D_{\alpha}\phi_{j} = \int_{\Omega} A_{ij}^{\alpha \beta} Dv^{\alpha}D_{\alpha}\phi_{j} \forall \phi \in W^{1, 2}_{0}(\Omega)^N.$$  

Therefore, it follows from (3.43), (3.46), and (3.48) that $u$ defined in (2.16) is a weak solution in $W^{1, 2}_{0}(\Omega)^N$ of $Lu = -f$.

Now, we prove the uniqueness. Suppose that there exists another matrix valued function $\tilde{G}(x, y)$ such that $\tilde{G}(x, y)$ is continuous in $\{(x, y) \in \Omega \times \Omega : x \neq y\}$, $G(x, \cdot)$ is locally integrable in $\Omega$ for all $x \in \Omega$, and for all $f \in C_{c}^{\infty}(\Omega)^N$, the function $\tilde{u}(x) := \int_{\Omega} \tilde{G}(x, y)f(y) \, dy$ is a weak solution of $L \tilde{u} = -f$ in $W^{1, 2}_{0}(\Omega)^N$. Then, the difference $w := u - \tilde{u}$ is a weak solution of $Lw = 0$ in $W^{1, 2}_{0}(\Omega)^N$, and thus $w \equiv 0$. Therefore, we have

$$\int_{\Omega} (G - \tilde{G})(x, y)f(y) \, dy = 0 \forall f \in C_{c}^{\infty}(\Omega)^N.$$  

We conclude from (3.49) that $G(x, \cdot) \equiv \tilde{G}(x, \cdot)$ in $\Omega \setminus \{x\}$ for all $x \in \Omega$, and thus $G(x, y) = G(x, y)$ for all $x, y \in \Omega$ with $x \neq y$. We have proved the uniqueness.
3.2. Proof of identities (2.14) and (2.15). Let us first prove (2.14). From (3.3), (3.4) and the construction of the parabolic Green’s matrix $\Gamma(t,x,s,y)$ in [3], it follows that (cf. (3.3) in [3])

\[
\int_{\Omega} K_{kl}(t,\cdot,y)\phi^i + \int_{\Omega} A_{ij}^\alpha D_{\beta} \bar{K}_{jk}(t,\cdot,y) D_{\alpha} \phi^i = \phi^k(y) \quad \forall \phi \in C_c^\infty(\Omega)^N. 
\]

We note that (3.14) yields

\[
\lim_{t \to \infty} \int_{\Omega} K_{kl}(t,\cdot,y)\phi^i = 0 \quad \forall k = 1,\ldots,N.
\]

If we write $\phi = \zeta \phi + (1 - \zeta)\phi$, where $\zeta \in C_c^\infty(B_r(y))$ such that $\zeta \equiv 1$ on $B_{r/2}(y)$, then

\[
\int A_{ij}^\alpha D_{\beta} \bar{K}_{jk}(t,\cdot,y) D_{\alpha} \phi^i = \int_{B_{r}(y)} A_{ij}^\alpha D_{\beta} \bar{K}_{jk}(t,\cdot,y) D_{\alpha} (\zeta \phi^i) + \int_{\Omega \setminus B_{r/2}(y)} A_{ij}^\alpha D_{\beta} \bar{K}_{jk}(t,\cdot,y) D_{\alpha} ((1 - \zeta)\phi^i) = I_1(t) + I_2(t).
\]

By Lemma 3.23 and (3.11), we find that there exists an increasing sequence $\{t_m\}_{m=1}^\infty$ tending to infinity such that

\[
\lim_{m \to \infty} I_1(t_m) = \int_{B_{r}(y)} A_{ij}^\alpha D_{\beta} G_{jk}(\cdot,y) D_{\alpha} (\zeta \phi^i),
\]

\[
\lim_{m \to \infty} I_2(t_m) = \int_{\Omega \setminus B_{r/2}(y)} A_{ij}^\alpha D_{\beta} G_{jk}(\cdot,y) D_{\alpha} ((1 - \zeta)\phi^i).
\]

Therefore, by combining (3.50)–(3.54), we obtain (2.14).

Next, we prove (2.15). We claim

\[
\|(1 - \eta)\bar{K}(t,\cdot,y)\|_{W^{1,2}(\Omega)} \leq C(\eta,\gamma) < \infty \quad \forall t > 0,
\]

where $\eta \in C_c^\infty(\Omega)$ is such that $\eta \equiv 1$ on $B_r(y)$ for some $r < d_y$. Assume for the moment that the claim is true. Then, by the weak compactness and (3.11), there exists an increasing sequence $\{t_m\}_{m=1}^\infty$ tending to infinity such that

\[
(1 - \eta)\bar{K}(t_m,\cdot,y) \rightharpoonup (1 - \eta)G(\cdot,y) \quad \text{weakly in } W^{1,2}(\Omega).
\]

On the other hand, by [3] Theorem 2.7, we find that $(1 - \eta)\bar{K}(t,\cdot,y) \in W^{1,2}_0(\Omega)$ for all $t > 0$. Since $W^{1,2}_0(\Omega)$ is weakly closed in $W^{1,2}(\Omega)$, we have $(1 - \eta)G(\cdot,y) \in W^{1,2}_0(\Omega)$, as desired. To complete the proof of (2.15), it remains to prove the claim (3.55). In fact, by Lemma 3.3 it is enough to show

\[
\|D((1 - \eta)\bar{K}(t,\cdot,y))\|_{L^2(\Omega)} \leq C(\eta) < \infty \quad \forall t > 0.
\]

Let us prove (3.56). Assume that $\eta$ is supported in a ball $B \subset \mathbb{R}^2$. Then

\[
\|D((1 - \eta)\bar{K}(t,\cdot,y))\|_{L^2(\Omega)} \leq \|1 - \eta\|_{L^\infty} \|D\bar{K}(t,\cdot,y)\|_{L^2(\Omega \setminus B_r(y))}
\]

\[
+ \|D\eta\|_{L^\infty} \|\bar{K}(t,\cdot,y)\|_{L^2(B \setminus B_r(y))}
\]

\[
\leq C(\eta) \|D\bar{K}(t,\cdot,y)\|_{L^2(\Omega \setminus B_r(y))} + C(\eta) |B|^{1/4} \|ar{K}(t,\cdot,y)\|_{L^4(\Omega \setminus B_r(y))}
\]

\[
\leq C(\eta) C(\gamma,\gamma) < \infty \quad \forall t > 0,
\]

where we have used Lemma 3.23 in the last step. This completes the proof of (3.56), and thus (2.15) is proved.
3.3. Proof of logarithmic bound \((2.17)\) and \(L^p\) estimates. Without loss of
generality, we may assume \(d_y \geq d_{z}\); otherwise, in light of \((2.18)\),
we may exchange the role of \(x\) and \(y\). Note that if \(|x - y| < R = d_y/2\), then \((3.10)\) yields

\[
|K(t, x, y)| \leq C \left\{ \max \left( \sqrt{t}, |x - y| \right) \right\}^{-2} \quad \forall t \in (0, R^2).
\]

On the other hand, if we set \(\rho = R/2\) in \((3.13)\) and \(r = \sqrt{3R}/2\) in \((3.14)\) (note that
\(\rho < d_x, r < d_y\), and \(\rho^2 + r^2 = R^2\)), then \((3.15)\) becomes

\[
|K(t, x, y)| \leq CR^{-2}e^{-2\lambda(t-R^2)} \quad \forall t > R^2.
\]

Then, by using \((3.58)\) and \((3.59)\), we obtain (recall \(|x - y| < R\))

\[
|G(x, y)| \leq C \int_0^{|x-y|^2} |x - y|^{-2} \, dt + \int_{|x-y|^2}^{R^2} t^{-1} \, dt + \int_{R^2}^{\infty} R^{-2} e^{-2\lambda(t-R^2)} \, dt
\]

\[
= C(1 + 2\ln(R/|x - y|) + R^{-2}(2\lambda^{-1})^j)
\]

\[
\leq C(R^{-2}\gamma^j + \ln(R/|x - y|)).
\]

We have thus proved \((2.17)\). We now turn to the proof of local \(p\)-summability of
\(G(\cdot, y)\) and \(DG(\cdot, y)\). Note that \((3.60)\) particularly implies that

\[
\|G(\cdot, y)\|_{L^p(B_\rho(y))} \leq C(\rho, d_y, \gamma) < \infty \quad \forall \rho \in (0, d_y/2) \quad \forall \rho \in [1, \infty).
\]

We claim that \(|DG(\cdot, y)| \in L^p(B_\rho(y))\) for all \(0 < \rho < d_y\) and \(1 \leq p < 2\). Let \(u\) be
the \(k\)-th column of \(G(\cdot, y)\). Then, by \((2.15)\), we have

\[u \in W^{1,2}(\Omega \setminus B_\rho(y))^N \quad \forall \rho \in (0, d_y)\]

and thus, by \((2.24)\), we find that \(u\) is a weak solution of \(Lu = 0\) in \(\Omega \setminus B_\rho(y)\) for any
\(\rho < d_y\). It follows from \((2.17)\) that there is \(r_0 = r_0(\gamma, d_y) < 1\) and \(C_0 = C_0(\gamma, d_y) < \infty\) such that

\[
|G(x, y)| \leq C_0 \ln(1/|x - y|) \quad \forall x \in B_{r_0}(y).
\]

Fix \(r < r_0\) and let \(\zeta \in C^\infty_c(B_{r}(y))\) be a cut-off function satisfying \(\zeta \equiv 1\) on \(\overline{B}_{r/2}(y)\)
and \(|\nabla \zeta| \leq C/\rho\). Then, by \((2.15)\) we find

\[
(1 - \zeta)^2 u \in W^{1,2}(\Omega')^N, \quad \text{where } \Omega' := \Omega \setminus \overline{B}_{r/2}(y).
\]

Since \(u\) is a weak solution in \(W^{1,2}(\Omega')^N\) of \(Lu = 0\), by using \((3.63)\) we have

\[0 = \int_{\Omega'} (1 - \zeta)^2 A_{ij}^\alpha \partial_i \partial_j u^\alpha D^\alpha u^i - \int_{\Omega'} 2(1 - \zeta) A_{ij}^\alpha \partial_i \partial_j u^\alpha \zeta u^i.
\]

Therefore, by using the bound \((3.62)\) we estimate

\[
\int_{\Omega \setminus B_{r}(y)} |Du|^2 \leq C r^{-2} \int_{B_r(y) \setminus B_{r/2}(y)} |u|^2 \leq CC_0^2(\ln(r/2))^2.
\]

Therefore, we have

\[
\int_{\Omega \setminus B_{r}(y)} |DG(\cdot, y)|^2 \leq CC_0^2(\ln(r/2))^2 \quad \forall r < r_0.
\]

Next, let \(A_t = \{x \in \Omega : |D_x G(x, y)| > t\}\) and choose \(r = 2/t\). Then by \((3.64)\)

\[
|A_t \setminus B_r(y)| \leq t^{-2} \int_{A_t \setminus B_r(y)} |DG(\cdot, y)|^2 \leq CC_0^2 t^{-2}(\ln t)^2 \quad \forall t > 2/r_0.
\]
and $|A_t \cap B_r(y)| \leq |B_r(y)| \leq Ct^{-2}$. Therefore, we conclude that for any $y \in \Omega$, there exist $C_1 = C_1(\gamma, d_y) < \infty$ and $t_0 = t_0(\gamma, d_y) > 0$ such that

$$
(3.65) \quad \{|x \in \Omega : |D_x G(x, y)| > t\} \leq C_1 t^{-2} (\ln t)^2 \quad \forall t > t_0.
$$

From the estimates (3.66), it follows that $|DG(\cdot, y)| \in L^p(B_r(y))$ for all $r < d_y$ and for all $p \in [1, 2)$ as we shall demonstrate below. Let $r < d_y$ be given and choose $\tau > t_0$. Note that the above integrals converge if $0 < p < 2$, and thus we have shown that

$$
(3.66) \quad \int_{B_r(y)} |DG(\cdot, y)|^p = \int_0^\infty p t^{p-1} \{ |DG(\cdot, y)| > \max(t, \tau) \} dt
$$

$$
\leq C_1 \tau^{-2} (\ln \tau)^2 \int_0^\tau p t^{p-1} dt + C_1 \int_\tau^\infty p t^{p-3} (\ln t)^2 dt.
$$

By using (3.65), we estimate (recall $\tau > t_0$)

$$
\int_{\{DG(\cdot, y) > \tau\}} |DG(\cdot, y)|^p = \int_0^\infty p t^{p-1} \{ |DG(\cdot, y)| > \max(t, \tau) \} dt
$$

$$
\leq C_1 \tau^{-2} (\ln \tau)^2 \int_0^\tau p t^{p-1} dt + C_1 \int_\tau^\infty p t^{p-3} (\ln t)^2 dt.
$$

Note that the above integrals converge if $0 < p < 2$, and thus we have shown that

$$
(3.66) \quad \int_{B_r(y)} |DG(\cdot, y)|^p \leq C(p, \gamma, d_y, r) < \infty \quad \forall r \in (0, d_y) \quad \forall p \in [1, 2).
$$

On the other hand, (3.27) yields

$$
(3.67) \quad \|DG(\cdot, y)\|_{L^2(\Omega \setminus B_r(y))} \leq C \gamma^{-1} r^{-2} \quad \forall r \in (0, d_y).
$$

By combining (3.66) and (3.67), we find

$$
(3.68) \quad \|DG(\cdot, y)\|_{L^p(B_r(y) \cap \Omega)} < C(p, \gamma, d_y, r) < \infty \quad \forall r > 0 \quad \forall p \in [1, 2).
$$

Next, for $r \geq d_y/2$, fix a cut-off function $\zeta \in C^\infty_c(B_{2r}(y) \setminus B_{d_y/4}(y))$ such that $\zeta \equiv 1$ on $\overline{B}_r(y) \setminus B_{d_y/2}(y)$ and $|D\zeta| \leq C/d_y$. By a similar computation as in (3.37), we have

$$
\|D(\zeta G(\cdot, y))\|_{L^2(B_{2r}(y) \cap \Omega)} \leq C(\gamma, d_y, r) < \infty.
$$

Since $\zeta G(\cdot, y) \in W^{1,2}_0(B_{2r}(y) \cap \Omega)$, the Sobolev inequality yields

$$
(3.69) \quad \|G(\cdot, y)\|_{L^p(B_r(y) \cap \Omega \setminus \overline{B}_{d_y/2}(y))} < C(p, \gamma, d_y, r) < \infty \quad \forall p \in [1, 2).
$$

Then by combining (3.64) and (3.69), we obtain

$$
(3.70) \quad \|G(\cdot, y)\|_{L^p(B_r(y) \cap \Omega)} < C(p, \gamma, d_y, r) < \infty \quad \forall r > 0 \quad \forall p \in [1, 2).
$$
Finally, from (2.18), (3.68), and (3.70), it follows that \(|DG(x,\cdot)|\) belongs to \(L^p(B_r(x)\cap\Omega)\) for all \(r > 0\) and \(1 \leq p < 2\) and that \(|G(x,\cdot)|\) belongs to \(L^p(B_r(x)\cap\Omega)\) for all \(r > 0\) and \(1 \leq p < \infty\). This completes the proof of the theorem.

4. Proof of Theorem 2.21

Throughout this section, we employ the letter \(C\) to denote a constant depending on \(\lambda, \Lambda, N,\) and \(M := \|\varphi\|_\infty\). We use \(C(\alpha, \beta, \ldots)\) to denote a constant depending on quantities \(\alpha, \beta, \ldots\), as well as \(\lambda, \Lambda, N, M\).

For \(x = (x_1, x_2) \in \Omega\), where \(\Omega\) is as in (2.20), we shall denote \(\bar{x} := (x_1, \varphi(x_1)) \in \partial\Omega\). Note that \(d_x\) is comparable to \(|x - \bar{x}|\); more precisely, we have

\[
d_x \leq |x - \bar{x}| \leq \sqrt{1 + M^2}d_x \quad \forall x \in \Omega.
\]

We shall use the following notation:

\[
P_r^{-}(t_0, x_0) := \{(t, x) \in \mathbb{R} \times \Omega : t_0 - r^2 < t < t_0, |x - x_0| < r\},
\]

\[
S_r^{-}(t_0, x_0) := \mathbb{R} \times \partial\Omega \cap \partial P_r^{-}(t_0, x_0).
\]

We ask the readers to consult [3] or [14] for the definition of the space \(V_2\).

**Lemma 4.4.** Assume that the operator \(L\) satisfies the conditions (2.2) and (2.3). Let \(\Omega\) be given as in (2.20) and let \(\bar{x}_0 \in \partial\Omega\). Assume that \(u(t, x)\) is a weak solution in \(V_2(P_{2R}^{-}(t_0, \bar{x}_0))\) of \(u - Lu = 0\) and vanishes on \(S_{2R}^{-}(t_0, \bar{x}_0)\). Then, for any \(y_0 \in \partial P_{2R}^{-}(t_0, \bar{x}_0)\), we have

\[
\int_{P_{2R}^{-}(t_0, \bar{x}_0)} |D_x u|^2 \leq C \left(\frac{P}{r}\right)^{2+2\mu} \int_{P_r^{-}(t_0, y_0)} |D_x u|^2 \quad \forall \rho < r \leq R,
\]

where \(\mu = \mu(\lambda, \Lambda, M) \in (0, 1)\). As a consequence, for all \(t \in (t_0 - R^2, t_0)\), we have

\[
|u(t, x) - u(t, x')| \leq C|x - x'|^\mu R^{-(1+\mu)} \left(\int_{P_{2R}^{-}(t_0, \bar{x}_0)} |D_x u|^2\right)^{1/2} \quad \forall x, x' \in B_R(\bar{x}_0).
\]

**Proof.** Let \(v(x)\) be a weak solution in \(W^{1,2}(\Omega \cap B_{2R}(\bar{x}_0))\) of \(Lv = 0\) which vanishes on \(\partial\Omega \cap B_{2R}(\bar{x}_0)\). Let \(y_0 \in B_{2R}(\bar{x}_0) \cap \Omega\). By a well-known boundary regularity theory for weak solutions of elliptic systems in two dimensional Lipschitz domains (see, e.g., [13]), we have

\[
\int_{B_{\rho}(y_0) \cap \Omega} |Dv|^2 \leq C \left(\frac{P}{r}\right)^{2\mu} \int_{B_{\rho}(y_0) \cap \Omega} |Dv|^2 \quad \forall \rho < r \leq R,
\]

where \(\mu = \mu(\lambda, \Lambda, M) \in (0, 1)\). By a routine adjustment of an argument in [13], one can deduce (4.5) and (4.6) from (4.7). \(\square\)

Let \(\Omega\) be given as in (2.20). It is rather tedious but routine to check that the estimate (4.5) allows us to treat \(\Omega\) as if \(\Omega = \mathbb{R}^2\) in the proof of [3, Theorem 2.7].
Consequently, we have the following estimates:

\[ |K(t, x, y)| \leq C \{ \max(|t|^{1/2}, |x - y|) \}^{-2}, \]  
(4.8)
\[
\int_{\Omega} |K(t, x, y)|^2 \, dx \leq Ct^{-1} \quad \forall t > 0,
\]  
(4.9)
\[
\int \int_{(0, \infty) \times \Omega \setminus (0, r^2) \times B_r(y)} |D_x K(t, x, y)|^2 \, dx \, dt \leq Cr^{-2} \quad \forall r > 0,
\]  
(4.10)
\[
\int \int_{(0, r^2) \times (B_r(y) \cap \Omega)} |D_x K(t, x, y)|^p \, dx \, dt \leq C(p) r^{-3p+4} \quad \forall r > 0 \quad \forall p \in [1, 4/3).
\]  
(4.11)

To show the convergence of the integral in (3.11), we need the following lemma.

**Lemma 4.12.** Let \( \Omega \) be given as in (2.8). There exists \( \mu = \mu(\lambda, \Lambda, M) \in (0, 1) \) such that

\[ |K(t, x, y)| \leq C d_x^\mu \{ \max(|t|^{1/2}, |x - y|) \}^{-2-\mu} \quad \forall x, y \in \Omega, \quad x \neq y. \]  
(4.13)

**Proof.** Denote \( r := \max(|t|^{1/2}, |x - y|) \). We may assume that \( d_x < r/(10\sqrt{1+M^2}) \); otherwise, (4.13) is an easy consequence of (4.8). Let \( u(t, x) \) be the \( k \)-th column of \( K(t, x, y) \) and set \( R = r/4 \). Then by (4.11), (4.10), and (4.11), we have

\[ |u(t, x)| = |u(t, x) - u(t, \bar{x})| \leq C|x - \bar{x}|^{-1+\mu} R^{-2-\mu} \left( \int \int_{(0, \infty) \times \Omega \setminus (0, R^2) \times B_R(y)} |D_x u|^2 \right)^{1/2} \]
\[ \leq C|x - \bar{x}|^{\mu} R^{-2-\mu} \leq C d_x^\mu r^{-2-\mu}. \]

We obtain (4.13) from (4.14). The lemma is proved. \( \square \)

Then, it follows from (4.13) that for all \( x, y \in \Omega \) with \( x \neq y \), we have

\[ \int_0^\infty |K(t, x, y)| \, dt = \int_0^{x-y} \frac{d}{|x-y|^2} + \int_{x-y}^\infty |K(t, x, y)| \, dt \leq C d_x^\mu |x - y|^{-\mu} < \infty. \]
(4.15)

Therefore, \( G(x, y) \), given the same as in (3.11), is well defined and satisfies

\[ |G(x, y)| \leq C d_x^\mu |x - y|^{-\mu} \quad \forall x, y \in \Omega, \quad x \neq y. \]
(4.16)

In fact, by using (4.8) and (4.13) together, we may obtain a better bound

\[ |G(x, y)| \leq C \left( \int_0^{x-y} \frac{d}{|x-y|^2} \, dt + \int_{|x-y|^2}^{x-y} t^{-1} \, dt + \int_{|x-y|^2}^{x-y} d_x^\mu t^{-1-\mu/2} \, dt \right) \leq C(1 + \ln(d_x/|x - y|)) \quad \text{if} \quad |x - y| < d_x. \]
(4.17)

Then by combining (4.16) and (4.17), we derive (recall \( \ln^+ t := \max(\ln t, 0) \))

\[ |G(x, y)| \leq C \min \{ 1 + \ln^+(d_x/|x - y|), d_x^\mu |x - y|^{-\mu} \} \quad \forall x, y \in \Omega, \quad x \neq y. \]
(4.18)
Recall that (2.18) is a consequence of (3.21), which remains valid here. Therefore, (2.22) follows from (2.18) and (4.18). Note that (2.22) implies that for any $p > 0$
and $r [1, \infty)$

\begin{equation}
(4.19)
\left\| G(x, \cdot) \right\|_{L^p(B_r(x) \cap \Omega)} \leq C(p, d_x, r) < \infty;
\end{equation}

In particular, we have shown that $G(x, \cdot)$ is locally integrable for all $x \in \Omega$. Next, we show that $G(\cdot, y)$ is locally Hölder continuous in $\Omega \setminus \{y\}$. Fix $x_0 \in \Omega$ with $x_0 \neq y$ and choose $r > 0$ such that $r < d_y$ and $B_{2r}(x_0) \subseteq \Omega \setminus B_r(y)$. Similarly as in (4.14), Lemma 4.4 yields

\begin{equation}
(4.20)
|K(t, x, y) - K(t, x_0, y)| \leq C|x - x_0|^{\mu/2} \forall t > t_0,
\end{equation}

where $t_0 := 8(r + \sqrt{1 + M^2 d_x})^2$. Notice that (3.17) still remains true here. Therefore, by using (4.20) instead of (3.18) and proceeding as in (3.19), we obtain

\begin{equation}
(4.21)
|G(x, y) - G(x_0, y)| \leq C|x - x_0|^{\mu} \forall x \in B_r(x_0).
\end{equation}

Then, it follows from (2.18) and (4.21) that $G(x, y)$ is continuous in $\{x, y\} \in \Omega \times \Omega : x \neq y$.

Now let us prove that $u$ defined as in (2.10) is a unique weak solution in $Y^{1,2}(\Omega)^N$ of $Lu = -f$. First observe that $\Omega$ is a Green domain. Let $v(t, x)$ be defined the same as in (3.40). Then as in (3.41), we have $\lim_{t \to \infty} v(t, x) = u(x)$. Also, $v_t(t, x)$ has the same representation as in (3.42). Then, by (3.9) and Minkowski’s inequality, we have

\begin{equation}
(4.22)
\|v_t(t, \cdot)\|_{L^2(\Omega)} \leq Ct^{-1/2}\|f\|_{L^1(\Omega)} \forall t > 0
\end{equation}

and thus, by Lemma 3.44, we estimate

\begin{equation}
(4.23)
\|v(t, \cdot)\|_{L^2(\Omega)} \leq C\|f\|_{L^1(\Omega)} \int_0^t s^{-1/2} ds \leq Ct^{1/2}\|f\|_{L^1(\Omega)} \forall t > 0.
\end{equation}

Assume that $f$ is supported in a ball $B \subset \mathbb{R}^2$. Then by setting $\phi = v(t, \cdot)$ in (3.46), we get

\begin{equation}
\lambda \left\| Dv(t, \cdot) \right\|_{L^2(\Omega)} \leq \|v_t(t, \cdot)\|_{L^2(\Omega)} \|v(t, \cdot)\|_{L^2(\Omega)} + \|f\|_{L^2(\Omega \cap B)} \|v(t, \cdot)\|_{L^2(\Omega \cap B)}
\end{equation}

\begin{equation}
(4.24)
\leq C\|f\|_{L^1(\Omega \cap B)} + C(\Omega, B)\|f\|_{L^2(\Omega \cap B)} \|Dv(t, \cdot)\|_{L^2(\Omega)}.
\end{equation}

where we have used (4.22), (4.23), and (2.6). Then by applying Cauchy-Schwarz inequality to (4.24), we find

\begin{equation}
(4.25)
\left| Dv(t, \cdot) \right|^2_{L^2(\Omega)} \leq C(\Omega, B) \left( \|f\|^2_{L^1(\Omega \cap B)} + \|f\|^2_{L^2(\Omega \cap B)} \right) \leq C(\Omega, B)\|f\|^2_{L^2(\Omega)} \forall t > 0.
\end{equation}

Therefore, by the weak compactness and (3.41), we conclude that there exists an increasing sequence $\{t_m\}_m$ tending to infinity such that $Dv(t_m, \cdot) \rightharpoonup Du$ weakly in $L^2(\Omega)^N$ so that (3.38) holds. Also, by (4.25) we find $\left| Dv(t, \cdot) \right|_{L^2(\Omega)} < \infty$. By using (2.6) and (4.25) it is not hard to verify that for any $\zeta \in C_c^\infty(\mathbb{R}^2)$,

\begin{equation}
\|\zeta v(t, \cdot)\|_{W^{1,2}(\Omega)} \leq C(\zeta, \Omega, B)\|f\|_{L^2(\Omega)} < \infty \forall t > 0.
\end{equation}

Therefore, we conclude that $\zeta u \in W^{1,2}_0(\Omega)^N$ for all $\zeta \in C_c^\infty(\Omega)$, and thus $u \in Y^{1,2}_0(\Omega)^N$. Consequently, it follows from (3.46), (3.48), (4.22) and Lemma 2.20 that $u$ is a unique weak solution in $Y^{1,2}_0(\Omega)^N$ of $Lu = -f$. 

Let the Green's matrix in $\Omega$.

We need the following lemma to prove \((4.13)\) and \((4.15)\).

**Lemma 4.26.** Let $\Omega$ be given as in \((4.20)\). Then, for all $y \in \Omega$ and for all $t > 0$, we have

\[
\|D\tilde{K}(t, \cdot, y)\|_{L^p(B_{\rho}(y) \cap \Omega)} \leq C(p)\rho^{2/p-1} \quad \forall \rho > 0 \quad \forall p \in (1, 4/3),
\]

\[
\|D\tilde{K}(t, \cdot, y)\|_{L^2(\Omega \setminus B_{\rho}(y))} \leq C(1 + d^\mu_{\rho}r^{-\mu}) \quad \forall r > 0.
\]

**Proof.** We proceed similarly as in the proof of Lemma 3.23. Let us begin by proving \((4.27)\) first. By Minkowski’s inequality, we have

\[
\left(\int_{B_{\rho}(y) \cap \Omega} |D_x\tilde{K}(t, x, y)|^p dx \right)^{1/p} \leq \int_0^{\rho^2} + \int_{\rho^2}^\infty \left(\int_{B_{\rho}(y) \cap \Omega} |D_x\tilde{K}(s, x, y)|^p dx \right)^{1/p} ds := I_1 + I_2.
\]

Then, by Hölder’s inequality and \((4.11)\), we have

\[
I_1 \leq \left(\int_0^{\rho^2} \int_{B_{\rho}(y) \cap \Omega} |D_x\tilde{K}(s, x, y)|^p dx ds \right)^{1/p} \rho^{2(1-1/p)} \leq C(p)\rho^{-1+2/p}.
\]

On the other hand, by using Hölder’s inequality

\[
I_2 \leq C(p)\rho^{2/p} \sum_{j=1}^\infty \left(\int_{\rho^2}^{(j+1)^2\rho^2} \int_{B_{\rho}(y) \cap \Omega} |D_x\tilde{K}(s, x, y)|^2 dx ds \right)^{1/2} := C(p)\rho^{2/p} \sum_{j=1}^\infty I_{2,j}.
\]

By setting $r = \sqrt{j + 1}/2\rho$ in \((4.5)\) and using \((4.10)\), we estimate

\[
(I_{2,j})^2 = \int_{P_{(2r^2, y)}} |D_x\tilde{K}(t, x, y)|^2 dx dt \leq C \left(\frac{\rho}{r}\right)^{2+2\mu} \int_{P_{(2r^2, y)}} |D_x\tilde{K}(t, x, y)|^2 dx dt \leq C \left(\frac{\rho}{r}\right)^{2+2\mu} \int_{(0,\infty) \times \Omega \setminus (r, r^2) \times B_{\rho}(y)} |D_x\tilde{K}(t, x, y)|^2 dx dt \leq C\rho^{2+2\mu}r^{-4-2\mu} = C\rho^{-2(j+1)-2\mu}.
\]

Therefore, by combining \((4.30)\) and \((4.31)\), we find

\[
I_2 \leq C(p)\rho^{2/p-1} \sum_{j=1}^\infty (j + 1)^{-1-\mu/2} = C(p)\rho^{2/p-1},
\]

and thus \((4.27)\) follows from \((4.20)\) and \((4.32)\).

Next, we turn to the proof of \((4.28)\). As before, Minkowski’s inequality yields

\[
\left(\int_{\Omega \setminus B_{\rho}(y)} |D_x\tilde{K}(t, x, y)|^2 dx \right)^{1/2} \leq \int_0^{r^2} + \int_{r^2}^\infty \left(\int_{\Omega \setminus B_{\rho}(y)} |D_x\tilde{K}(s, x, y)|^2 dx \right)^{1/2} ds := I_3 + I_4.
\]
I_{3} \leq \left( \int_{0}^{r} \int_{\Omega \setminus B_r(y)} |D_x K(s, x, y)|^2 \, dx \, ds \right)^{1/2} \quad r \leq C.

We need the following inequality to estimate $I_4$:

$$I_5(t) := \int_{t}^{\infty} \int_{\Omega \setminus B_r(y)} |D_x K(s, x, y)|^2 \, dx \, ds \leq C d_y^{2 \mu} t^{-1 - \mu} \quad \forall r > 0 \, \forall t > 0.$$ 

Let us momentarily assume that (4.34) holds and proceed similarly as in (4.31) to get

$$I_4 \leq \left( \int_{r^2}^{\infty} \int_{\Omega \setminus B_r(y)} |D_x K(s, x, y)|^2 \, dx \, ds \right)^{1/2}
\leq \sum_{j=0}^{\infty} 2^{j/2} r \left( \int_{2j+1/2}^{2j+2} \int_{\Omega} |D_x K(s, x, y)|^2 \, dx \, ds \right)^{1/2}
\leq C d_y^{\mu} r^{-\mu} \sum_{j=0}^{\infty} 2^{-j \mu/2} \leq C d_y^{\mu} r^{-\mu}.$$

By combining (4.33) and (4.35), we obtain (4.28). It only remains to prove (4.34).

Note that by (4.13) and (3.21) we have

$$|K(s, x, y)| \leq C d_y^{\mu} \{\max(s^{1/2}, |x - y|)\}^{-2 - \mu} \quad \forall x \neq y \quad \forall s > 0.$$

Let $\zeta \in C^\infty(\mathbb{R})$ be such that $0 \leq \zeta \leq 1$, $\zeta \equiv 1$ on $[t, \infty)$, $\zeta \equiv 0$ on $(-\infty, t/2]$, and $|\zeta'| \leq 4/t$. Then, by the energy inequality (see, e.g., [14, \S III.2]) and (4.36), we have

$$I_5(t) \leq \int_{0}^{\infty} \int_{\Omega} \zeta(s) |D_x K(s, x, y)|^2 \, dy \, ds \leq C \int_{0}^{\infty} \int_{\Omega} |\zeta'(s)||K(s, x, y)|^2 \, dy \, ds
\leq C t^{-1} d_y^{2 \mu} \int_{1/2}^{t} \left( \int_{|x-y|<\sqrt{s}} s^{-2-\mu} \, dy + \int_{|x-y|\geq\sqrt{s}} |x-y|^{-4-2\mu} \, dy \right) \, ds
\leq C t^{-1} d_y^{2 \mu} \int_{1/2}^{t} s^{-1-\mu} \, ds \leq C d_y^{2 \mu} t^{-1-\mu}.$$

This completes the proof of the lemma.

We now prove (2.14) and (2.15). To prove (2.14), first recall that (3.50) holds. By (4.9), we find that (4.51) remains valid. Assume that $\phi \in C^\infty_c(\Omega)^N$ is supported in $B_R(y) \cap \Omega$. By (3.11) and (4.27), we find that there is a sequence $\{t_m\}_{m=1}^{\infty}$ tending to infinity such that

$$D\tilde{K}(t_m, \cdot, y) \rightharpoonup D\tilde{G}(\cdot, y) \quad \text{weakly in } L^p(B_R(y) \cap \Omega)^{N \times N} \text{ for some } p > 1.$$ 

Therefore, we find

$$\lim_{m \to \infty} \int_{\Omega} A_{ij}^{x\beta} D_\beta \tilde{K}_{jk}(\cdot, y) D_\alpha \phi^j = \int_{\Omega} A_{ij}^{x\beta} D_\beta G_{jk}(\cdot, y) D_\alpha \phi^j.$$

By combining (3.50), (3.51), and (4.37), we obtain (2.14). To prove (2.15), first observe that (4.28) yields

$$\|D\tilde{G}(\cdot, y)\|_{L^2(\Omega \setminus B_r(y))} \leq C(d_y, r) < \infty \quad \forall r > 0.$$
By using (4.19) and (4.38) and proceeding similarly as in (3.57), we obtain
\[ \|D((1-\eta)G(\cdot,y))\|_{L^2(\Omega)} \leq C(\eta,d_y) < \infty. \]

It follows from \[3\] Theorem 2.7 that for any \( \zeta \in C_0^\infty(\mathbb{R}^2) \), we have
\[ F(t,\cdot) := (1-\eta)\tilde{K}(t,\cdot,y) \in W^{1,2}_0(\Omega)^{N \times N} \quad \forall t > 0. \]

Clearly, \( \lim_{t \to \infty} F(t,\cdot) = (1-\eta)G(\cdot,y) \). Moreover, by utilizing \((5.22),\ (4.13), \) and \((4.28)\), it is not hard to verify \( \|F(t,\cdot)\|_{W^{1,2}(\Omega)} \leq C(\zeta,\eta,d_y) < \infty \) for all \( t > 0 \). Then, by a similar argument as in Section 3.2 we get \( (1-\eta)G(\cdot,y) \in W^{1,2}_0(\Omega)^{N \times N} \). We have proved (2.15).

Finally, notice that with (2.15) at hand, we may proceed similarly as in Section 3.3 to conclude that that \( DG(\cdot,y) \) and \( DG(x,\cdot) \) belong to \( L^p(B_r(y) \cap \Omega) \) and \( L^p(B_r(x) \cap \Omega) \), respectively, for all \( r > 0 \) and \( p \in [1,2] \). We have already seen in \((4.10)\) that \( G(\cdot,y) \) and \( G(x,\cdot) \) belong to \( L^p(B_r(y) \cap \Omega) \) and \( L^p(B_r(x) \cap \Omega) \), respectively, for all \( r > 0 \) and \( p \in [1,\infty) \). This completes the proof of the theorem.

5. REMARK ON FUNDAMENTAL MATRICES

In this section, we introduce a result of Auscher et al. \[1\] regarding construction of a fundamental matrix in \( \mathbb{R}^2 \). Let \( \mathcal{H}^1(\mathbb{R}^2) \) be the usual Hardy space in \( \mathbb{R}^2 \) and \( C_0(\mathbb{R}^2) \) be the space of continuous functions on \( \mathbb{R}^2 \) vanishing at infinity. For \( x,y \in \mathbb{R}^2, x \neq y \), define
\[ (5.1) \quad \Gamma(x,y) := \int_0^1 K(t,x,y) dt + \int_1^{\infty} (K(t,x,y) - K(t,x,x)) dt. \]

The following theorem appears in \[1\] as Theorem 3.16, where \( L \) is assumed to be an elliptic operator with complex coefficients. With appropriate changes, the same proof carries over.

**Theorem 5.2** (Auscher-McIntosh-Tchamitchian). Let the operator \( L \) satisfy \((2.2)\) and \((2.8)\). Then for all \( x \in \mathbb{R}^2, \Gamma(x,\cdot) \in BMO \), and for \( f = (f^1,\ldots,f^N)^T \in \mathcal{H}^1(\mathbb{R}^2)^N \), the function defined by
\[ Tf(x) := \int_{\mathbb{R}^2} \Gamma(x,y)f(y) dy \]
belongs to \( C_0(\mathbb{R}^2)^N \). The linear map thus defined is continuous from \( \mathcal{H}^1(\mathbb{R}^2)^N \) into \( C_0(\mathbb{R}^2)^N \). Moreover, for all \( f \in \mathcal{H}^1(\mathbb{R}^2)^N \), \( u(x) := Tf(x) \) satisfies \( \|Du\|_{L^2(\mathbb{R}^2)} < \infty \) and is a weak solution of \( Lu = -f \) in the sense of \((2.10)\).
