WEIGHTED SOBOLEV SPACES AND EMBEDDING THEOREMS

V. GOL’DSHITEIN AND A. UKHLOV

Abstract. In the present paper we study embedding operators for weighted Sobolev spaces whose weights satisfy the well-known Muckenhoupt $A_p$-condition. Sufficient conditions for boundedness and compactness of the embedding operators are obtained for smooth domains and domains with boundary singularities. The proposed method is based on the concept of ‘generalized’ quasiconformal homeomorphisms (homeomorphisms with bounded mean distortion). The choice of the homeomorphism type depends on the choice of the corresponding weighted Sobolev space. Such classes of homeomorphisms induce bounded composition operators for weighted Sobolev spaces. With the help of these homeomorphism classes the embedding problem for nonsmooth domains is reduced to the corresponding classical embedding problem for smooth domains. Examples of domains with anisotropic Hölder singularities demonstrate the sharpness of our machinery comparatively with known results.

Introduction

Weighted Sobolev spaces are solution spaces of degenerate elliptic equations (see, for example, [1]). The type of a weight depends on the equation type. Similar to the classical theory of Sobolev spaces, embedding theorems of weighted Sobolev spaces are suitable for the corresponding elliptic boundary problems, especially for the existence and uniqueness of solutions. Embedding operators for weighted Sobolev spaces in smooth domains were studied by many authors (see, for example, [1]–[6]) with the help of the integral representations theory adopted to the weighted case. Weighted Sobolev spaces in nonsmooth domains were not studied before, except article [7], where some sufficient conditions for boundedness of the embedding operators were obtained. The main technical problem for the nonsmooth case is an adequate description of an interplay between weights and boundary types (singularities). The adequate choice allows us to obtain sharp Sobolev-type embeddings.

The relation between Jacobians of quasiconformal homeomorphisms and admissible weights for Sobolev and Poincaré inequalities was studied in [8]. In the present article we introduce a new approach based on the concept of ‘generalized’ quasiconformal homeomorphisms (or homeomorphisms with bounded mean distortion in another terminology) that induce bounded composition operators of weighted Sobolev spaces. These homeomorphisms transform the original embedding operators on nonsmooth domains to the embedding operators on smooth domains with a corresponding weight change. This approach was suggested in [9] for classical
Sobolev spaces on nonsmooth domains and can be briefly described with the help of the following diagram:

\[
\begin{array}{c}
W^1_p(D', w) \xrightarrow{\phi^*} W^1_q(D) \\
\downarrow \quad \downarrow \\
L_a(D', w) \xrightarrow{w^{-1}} L_s(D).
\end{array}
\]

Here the operator \( \phi^* f = f \circ \phi \) is a bounded composition operator of Sobolev spaces induced by a homeomorphism \( \phi \) that maps smooth domains \( D \subset \mathbb{R}^n \) onto non-smooth domains \( D' \subset \mathbb{R}^n \). Suppose that its inverse homeomorphism \( \phi^{-1} \) induces a bounded composition operator of corresponding Lebesgue spaces. If the Sobolev space \( W^1_p(D) \) permits a bounded (compact) embedding operator into \( L_s(D) \), then, using the corresponding compositions, we can construct the embedding operator of the weighted Sobolev space \( W^1_p(D', w) \) into \( L_a(D', w) \). The same scheme was used in the article [10] for the study of the embedding operators of \( W^2_2 \) into \( L_2 \) on nonsmooth bounded domains. In article [11] the same approach was applied to embedding problems for domains of Carnot groups.

Let us shortly describe the content of the paper. In section 1 we give necessary definitions and prove the density of smooth functions in weighted Sobolev spaces with weights satisfying the \( A_p \)-condition. Such weighted Sobolev spaces are Banach spaces. In section 2 we introduce classes of quasi-isometrical homeomorphisms and prove sufficient conditions for the compactness of the embedding operators for the weighted Sobolev spaces in domains quasi-isometrically equivalent to smooth ones. In section 3 we introduce classes of homeomorphisms with bounded mean distortion and study embedding operators for weighted Sobolev spaces defined on images of smooth domains. We apply these abstract results to domains with anisotropic Hölder-type singularities. The obtained estimates are sharper than the known result [7].

In section 5 we apply embedding theorems for weighted Sobolev spaces to degenerate elliptic boundary problems.

1. WEIGHTED SPACES

In this paper we study weighted Lebesgue and Sobolev spaces defined in the domains of \( n \)-dimensional Euclidean space \( \mathbb{R}^n \), \( n \geq 2 \).

Let \( D \) be an open subset of \( \mathbb{R}^n \), \( n \geq 2 \), and \( w : \mathbb{R}^n \rightarrow [0, \infty) \) be a locally summable nonnegative function, i.e., a weight. Define a weighted Lebesgue space \( L_p(D, w), 1 \leq p < \infty \), as a Banach space of locally summable functions \( f : D \rightarrow \mathbb{R} \) equipped with the following norm:

\[
\| f \|_{L_p(D, w)} = \left( \int_D |f|^p(x)w(x) \, dx \right)^{1/p}, \quad 1 \leq p < \infty.
\]

Define a weighted Sobolev space \( W^m_p(D, w), 1 \leq m < \infty, 1 \leq p < \infty \), as a normed space of locally summable, \( m \) times weakly differentiable functions \( f : D \rightarrow \mathbb{R} \) equipped with the following norm:

\[
\| f \|_{W^m_p(D, w)} = \left( \int_D |f|^p(x)w(x) \, dx \right)^{1/p} + \sum_{|\alpha|=m} \left( \int_D |D^\alpha f|^p(x)w(x) \, dx \right)^{1/p},
\]
where $\alpha := (\alpha_1, \alpha_2, ..., \alpha_n)$ is a multi-index, $\alpha_i = 0, 1, ..., |\alpha| = \alpha_1 + \alpha_2 + ... + \alpha_n$ and $D^\alpha f$ is the weak derivative of order $\alpha$ of the function $f$:

$$\int_D f D^\alpha \eta \, dx = (-1)^{|\alpha|} \int_D (D^\alpha f) \eta \, dx, \quad \forall \eta \in C_0^\infty(D).$$

As usual $C_0^\infty(D)$ is the space of infinitely smooth functions with compact support.

By technical reasons we will need also a seminormed space $L^m_p(D)$ of locally summable, $m$ times weakly differentiable functions $f : D \to \mathbb{R}$ equipped with the following seminorm:

$$\|f \mid L^1_p(D, w)\| = \sum_{|\alpha|=m} \left( \int_D |D^\alpha f|^p(x) w(x) \, dx \right)^{1/p}.$$

Without additional restrictions the space $W^m_p(D, w)$ is not necessarily a Banach space (see, for example, [1]).

Let us assume additionally that the weight $w : \mathbb{R}^n \to [0, \infty)$ satisfies the well-known $A_p$-condition:

$$\sup_{B \subset \mathbb{R}^n} \left( \frac{1}{|B|} \int_B w \right) \left( \frac{1}{|B|} \int_B w^{1/(1-p)} \right)^{p-1} < +\infty,$$

where $1 < p < \infty$, and $|B|$ is the Lebesgue measure of the ball $B$.

**Theorem 1.** Let $D \subset \mathbb{R}^n$ be an open set and let a weight $w$ satisfy the $A_p$-condition. Then $W^m_p(D, w)$, $1 \leq m < \infty$, $1 < p < \infty$, is a Banach space. Smooth functions of the class $W^m_p(D, w)$ are dense in $W^m_p(D, w)$.

Let us give some remarks before the proof.

Suppose that the nonnegative function $\omega : \mathbb{R}^n \to [0, \infty)$ belongs to $C^\infty(\mathbb{R}^n)$, supp $\omega \subset \overline{B}(0, 1)$ and

$$\int_{\mathbb{R}^n} \omega \, dx = 1.$$

Denote by

$$A_r f(x) = \frac{1}{r^n} \int_{\mathbb{R}^n} \omega \left( \frac{x - z}{r} \right) f(z) \, dz$$

a mollifier function of $f$ with a mollification kernel $\omega$.

Let $D_\delta = \{ x \in D : \text{dist}(x, \partial D) > \delta \}$ for $\delta > 0$. The proof of the theorem is based on the following lemma (see, for example, [12]):

**Lemma 1.** Let $D \subset \mathbb{R}^n$ be an open set and let a function $f \in L^1_{\text{loc}}(D)$ have a weak derivative $D^\alpha f$ on $D$. Then for every $0 < r < \delta$,

$$D^\alpha (A_r f) = A_r(D^\alpha f) \quad \text{on} \quad D_\delta.$$

**Proof.** For the reader’s convenience we reproduce here a version of the proof. Note, that for every $x \in D_\delta$,

$$(A_r f)(x) = \int_{B(0, 1)} f(x - rz) \omega(z) \, dz, \quad 0 < r < \delta.$$

By definition of the weak derivative, $D^\alpha_x(f(x - rz)) = (D^\alpha_x f)(x - rz)$ on $D_\delta$. 

License or copyright restrictions may apply to redistribution; see http://www.ams.org/journal-terms-of-use
Suppose \((x, z) \in D_{\delta} \times B(0, 1)\). Define \(F(x, z) = f(x - rz)\omega(z)\) and \(G(x, z) = (D^2_y f)(x - rz)\omega(z)\). Then for each compact \(K \subset D_{\delta}\) the functions \(F, G\) belong to \(L_1(K \times B(0, 1))\). Moreover, by Fubini’s theorem and the definition of the mollification kernel, we get

\[
\int_{K} \left( \int_{B(0, 1)} |f(x - rz)\omega(z)| \, dz \right) \, dx = \int_{K} \left( \int_{B(x, r)} \frac{1}{r^n} \int_{B(x, y)} |f(y)\omega(x - \frac{y}{r})| \, dy \right) \, dx
\]

\[
= \int_{K^r} \left( \int_{K} \frac{1}{r^n} \left| f(y)\omega(x - \frac{y}{r}) \right| \, dx \right) \, dy \leq \int_{K^r} \left| f(y) \right| \left( \int_{K} \omega(x - \frac{y}{r}) \, dx \right) \, dy
\]

\[
\leq \int_{K^r} \left| f(y) \right| \left( \int_{B(r)} \omega(x) \, dx \right) \, dy = \int_{K^r} \left| f(y) \right| \, dy = \| f \|_{L_1(K^r)}. \]

Here \(K^r\) is the \(r\)-neighborhood of \(K\), \(K^r \subset D\). Of course, the same estimate is correct for \(G\).

Using the Fubini theorem we have

\[
\int_{D_{\delta}} \left( \int_{B(0, 1)} D^\alpha_x f(x - rz)\omega(z) \, dz \right) \eta(x) \, dx = \int_{B(0, 1)} \left( \int_{D_x} D^\alpha_x f(x - rz)\omega(z) \, dz \right) \eta(x) \, dx
\]

\[
= (-1)^{\alpha} \int_{B(0, 1)} \left( \int_{D_x} f(x - rz)\omega(z) \left( D^\alpha \eta(x) \right) \, dz \right) \, dx
\]

\[
= (-1)^{\alpha} \int_{D_x} \left( \int_{B(0, 1)} f(x - rz)\omega(z) \, dz \right) D^\alpha \eta(x) \, dx
\]

for every function \(\eta \in C_0^\infty(D_{\delta})\).

Hence for every \(x \in D_{\delta}\),

\[
D^\alpha((A_r f)(x)) = D^\alpha\left( \int_{B(0, 1)} f(x - rz)\omega(z) \, dz \right)
\]

\[
= \int_{B(0, 1)} D^\alpha_x f(x - rz)\omega(z) \, dz = (A_r(D^\alpha f))(x).
\]

\[\Box\]

**Proof of Theorem 1.** Fix \(\delta > 0\). Since the weight \(w\) satisfies the \(A_p\)-condition, the Hardy-Littlewood maximal operator

\[
M f(x) = \sup_{\delta > r > 0} \frac{1}{r^n} \int_{B(x, r)} f(z) \, dz
\]
is bounded in $L_p(D_\delta, w)$ \[13\]. Hence

$$
\|A_r f - f \|_{L_p(D_\delta, w)} = \left( \int_{D_\delta} \left( \int_{B(0,1)} f(x - rz)\omega(z) \, dz - f(x) \right)^p w(x) \, dx \right)^{1/p}
$$

$$
= \left( \int_{D_\delta} \left( \int_{B(0,1)} (f(x - rz) - f(x))\omega(z) \, dz \right)^p w(x) \, dx \right)^{1/p}
$$

$$
\leq \|M\| \max_{x \in B(0,1)} \omega(x) \left( \int_{D_\delta} |f(x - rz) - f(x)|^p w(x) \, dx \right)^{1/p}.
$$

Here $\|M\|$ is the norm of the maximal operator in the space $L_p(D_\delta, w)$.

From the last inequality it follows, that for continuous functions $f$,

$$
A_r f \rightarrow f \quad \text{in} \quad L_p(D_\delta, w).
$$

Using an approximation of an arbitrary function $f \in L_p(D_\delta, w)$ by continuous functions (see, for example, \[14\]) the convergence can be obtained for $f \in L_p(D_\delta, w)$ also. \[\Box\]

By Lemma 1,

$$
A_r f \rightarrow f \quad \text{in} \quad W^m_p(D_\delta, w)
$$

for an arbitrary function $f \in W^m_p(D, w)$. Therefore smooth functions are dense in $W^m_p(D_\delta, w)$.

The density of smooth functions of class $W^m_p(D, w)$ in $W^m_p(D, w)$ will be proved using the scheme proposed in \[15\].

Choose a sequence of open sets $D_j \in D_{j+1} \in D$, $j \geq 1$, compactly embedded one into another, such that $\bigcup_j D_j = D$. Let $\Psi$ be a partition of unity on $D$, subordinate to the covering $D_{j+1} \setminus D_{j-1}$. Let $\psi$ denote the (finite) sum of those $\psi \in \Psi$ for which $\text{supp} \psi \subset D_{j+1} \setminus D_{j-1}$. Thus $\psi \in C^\infty_0(D_{j+1} \setminus D_{j-1})$ and $\sum_j \psi_j \equiv 1$ in $D$.

Fix $\varepsilon > 0$ and for each $j = 1, 2, \ldots$ choose $\varphi_j \in C^\infty_0(D_{j+1} \setminus D_{j-1})$ such that

$$
\|\varphi_j - \psi_j \|_{W^m_p(D, w)} \leq \varepsilon 2^{-j}.
$$

Then $\varphi = \sum_j \varphi_j \in C^\infty(D)$ and

$$
\|\varphi - f \|_{W^m_p(D, w)} = \left\| \sum_j \varphi_j - \sum_j \psi_j f \right\|_{W^m_p(D, w)}
$$

$$
\leq \sum_j \|\varphi_j - \psi_j f \|_{W^m_p(D, w)} < \varepsilon.
$$

Therefore, the weighted space $W^m_p(D, w)$ is a Banach space and smooth functions of the class $W^m_p(D, w)$ are dense in this space.

Denote by $w(A) = \int_A w(x) \, dx$ the weighted measure (the measure associated with the weight $w$) of a measurable set $A \subset \mathbb{R}^n$. By \[13\] the Muckenhoupt $A_p$-condition leads to the doubling condition for the weighted measure; i.e., $\mu(B(x, 2r)) \leq C \mu(B(x, r))$ for all $x \in \mathbb{R}^n$ and $r > 0$. 

License or copyright restrictions may apply to redistribution; see http://www.ams.org/journal-terms-of-use
Definition 1. We call a bounded subdomain $D$ of Euclidean space $\mathbb{R}^n$ an embedding domain if for any function $f \in L^q_1(D)$, $1 \leq q < n$, the Sobolev-Poincaré-type inequality

$$\inf_{c \in \mathbb{R}} \|f - c|L_r(D)\| \leq M\|f|L^q_1(D)\|$$

holds for any $r \leq nq/(n - q)$. Here a constant $M$ depends on $q$ and $r$ only.

Recall that for any embedding domain and for any $r < nq/(n - q)$ the corresponding embedding operator $W^1_r(D) \hookrightarrow L_r(D)$ is compact.

Lipschitz bounded domains $D \subset \mathbb{R}^n$ represent examples of embedding domains. Let us recall also that Sobolev-type embeddings for smooth domains have been studied thoroughly and a discussion about the different aspects of the embedding problem can be found, for example, in [16].

2. Quasi-isometrical mappings and Sobolev embeddings

Let $D$ and $D'$ be domains in Euclidean space $\mathbb{R}^n$, $n \geq 2$. A homeomorphism $\varphi : D \rightarrow D'$ is called $Q$-quasi-isometrical if there exists a constant $0 < Q < +\infty$, such that

$$\frac{1}{Q} \leq \varphi'(x) \leq Q$$

for all points $x \in D$. Here

$$\varphi'(x) = \liminf_{z \rightarrow x} \frac{|\varphi(x) - \varphi(z)|}{|x - z|} \text{ and } \varphi'(x) = \limsup_{z \rightarrow x} \frac{|\varphi(x) - \varphi(z)|}{|x - z|}.$$

It is well known that any $Q$-quasi-isometrical homeomorphism is locally bi-Lipschitz, weakly differentiable and differentiable almost everywhere in $D$. Hence its Jacobi matrix $D\varphi = (\frac{\partial \varphi_i}{\partial x_j})$, $i, j = 1, \ldots, n$ and its Jacobian $J(x, \varphi) = \det(\frac{\partial \varphi_i}{\partial x_j})$ are well defined almost everywhere in $D$. By definition of a $Q$-quasi-isometrical homeomorphism,

$$Q^{-n} \leq |J(x, \varphi)| \leq Q^n$$

almost everywhere.

Let us recall also that a quasi-isometrical homeomorphism has the Luzin $N$-property: the image of a set of measure zero is a set of measure zero.

Therefore, for any $Q$-quasi-isometrical homeomorphism $\varphi$, the change of variable formula in the Lebesgue integral

$$\int_{\varphi(E)} f(y) \, dy = \int_E f \circ \varphi(x)|J(x, \varphi)| \, dx$$

holds for any nonnegative measurable function $f$ and any measurable set $E \subset D$ [17].

Suppose weight $w$ satisfies the $A_p$-condition and that a homeomorphism $\varphi : \mathbb{R}^n \rightarrow \mathbb{R}^n$ is $Q$-quasi-isometrical. Combining the change of variable formula and the two-side estimate for $|J(x, \varphi)|$ we can conclude that the weight $w \circ \varphi$ also satisfies the $A_p$-condition.

Theorem 2. Let $\varphi : D \rightarrow D'$ be a $Q$-quasi-isometrical homeomorphism. Then a composition operator $\varphi^* f = f \circ \varphi$ is an isomorphism of the Sobolev spaces $W_{p}^{1}(D, w)$ and $W_{p}^{1}(D', w')$, $1 < p < \infty$, where $w = w' \circ \varphi$. 
Proof: Choose an arbitrary function $f \in W^1_p(D', w')$. By [14], $f$ belongs to the space $W^1_{1, \text{loc}}(D')$ and by [17] the composition $f \circ \varphi \in W^1_{1, \text{loc}}(D)$. Hence
\[
\| \varphi^* f \mid W_p^1(D, w) \| = \left( \int_D |f \circ \varphi|^p (w' \circ \varphi)(x) \, dx \right)^{\frac{1}{p}} + \left( \int_D |\nabla (f \circ \varphi)|^p (w' \circ \varphi)(x) \, dx \right)^{\frac{1}{p}}
\]
\[
\leq \left( \int_D |f \circ \varphi|^p (w' \circ \varphi)(x) |J(x, \varphi)| \frac{1}{|J(x, \varphi)|} \, dx \right)^{\frac{1}{p}} + \left( \int_D |\nabla f|^p (\varphi(x))(w' \circ \varphi)(x) |J(x, \varphi)| \frac{\| \varphi'(x) \|^p}{|J(x, \varphi)|} \, dx \right)^{\frac{1}{p}}.
\]
Since $\varphi$ is a $Q$-quasi-isometrical homeomorphism the following estimates are correct:
\[
\frac{1}{|J(x, \varphi)|} \leq Q^n \quad \text{for almost all} \ x \in D
\]
and
\[
|\varphi'(x)| \leq Q \quad \text{for almost all} \ x \in D.
\]
Hence
\[
\| \varphi^* f \mid W_p^1(D, w) \| \leq Q^{\frac{n}{p}} \left( \int_D |f \circ \varphi|^p (w' \circ \varphi)(x) |J(x, \varphi)| \, dx \right)^{\frac{1}{p}} + Q^{\frac{n+1}{p}} \left( \int_D |\nabla f|^p (\varphi(x))(w' \circ \varphi)(x) |J(x, \varphi)| \, dx \right)^{\frac{1}{p}}.
\]
Using the change of variable formula we finally get the following inequality:
\[
\| \varphi^* f \mid W_p^1(D, w) \| \leq Q^{\frac{n}{p}} \left( \int_{D'} |f|^p w'(y) \, dy \right)^{\frac{1}{p}} + Q^{\frac{n+1}{p}} \left( \int_{D'} |\nabla f|^p (y) w'(y) \, dy \right)^{\frac{1}{p}} \leq Q^{\frac{n}{p}} (Q + 1) \| f \mid W_p^1(D', w') \|.
\]
Since the inverse homeomorphism $\varphi^{-1}$ is also a $Q$-quasi-isometrical one, the inverse inequality
\[
\| (\varphi^{-1})^* g \mid W_p^1(D', w') \| \leq Q^{\frac{n}{p}} (Q + 1) \| g \mid W_p^1(D, w) \|, \quad g \in W_p^1(D, w),
\]
is also correct. 

**Corollary 1.** Let $D$ and $D'$ be domains in the Euclidean space $\mathbb{R}^n$. Suppose there exists a $Q$-quasi-isometrical homeomorphism $\varphi : D \to D'$. Then the embedding operator
\[
i : W_p^1(D, w) \hookrightarrow L_r(D, w)
\]
is bounded (compact) if and only if the embedding operator
\[
i' : W_p^1(D', w') \hookrightarrow L_r(D', w')
\]
is bounded (compact).
Proof. Suppose the embedding operator
\[ i : W^1_p(D, w) \hookrightarrow L_r(D, w) \]
is bounded (compact). Since \( \varphi^{-1} \) is a \( Q \)-quasi-isometrical homeomorphism, then a composition operator \( (\varphi^{-1})^* = g \circ \varphi^{-1} : L_r(D, w) \hookrightarrow L_r(D', w') \) is bounded, as one can see by a simple calculation:
\[
\| (\varphi^{-1})^* g \|_{L_r(D', w')} = \left( \int_{D'} |g \circ \varphi^{-1}|^r (y) w'(y) \, dy \right)^{\frac{1}{r}} = \left( \int_D |g|^r (x) w' \circ \varphi(x) J(x, \varphi) \, dx \right)^{\frac{1}{r}} \\
\leq Q^\frac{1}{p} \left( \int_D |g|^r w(x) \, dx \right)^{\frac{1}{r}} = Q^\frac{1}{p} \| g \|_{L_r(D, w)}.
\]
Therefore, the embedding operator \( i' : W^1_p(D', w') \hookrightarrow L_r(D', w') \) is bounded (compact) as a composition of bounded operators \( \varphi^* \), \( (\varphi^{-1})^* \) and a bounded (compact) embedding operator \( W^1_p(D, w) \hookrightarrow L_r(D, w) \).

The proof in the inverse direction is the same. \( \square \)

By Corollary 1 an image \( D' = \varphi(D) \) of an embedding domain \( D \) under a quasi-isometrical homeomorphism \( \varphi \) is an embedding domain also. In the paper \[10\] the various examples of embedding domains of such a type were discussed.

The next theorem demonstrates simple conditions for compactness of the embedding operators of weighted Sobolev spaces.

**Theorem 3.** Let \( D' \subseteq \mathbb{R}^n \) be a quasi-isometrical image of an embedding domain \( D \), \( 1 \leq s \leq r < nq/(n - q) \), \( q \leq p, 1 < p < \infty \), and
\[
K(w) = \max \left\{ \| w^{-\frac{1}{p}} \|_{L^q \frac{r}{p-q} (D')}, \| w^\frac{1}{q} \|_{L^q \frac{r}{q} (D')} \right\} < +\infty.
\]
Then the embedding operator
\[ i : W^1_p(D', w) \hookrightarrow L_s(D', w) \]
is a compact operator.

For \( r = nq/(n - q) \) the embedding operator \( i \) is bounded only.

**Proof.** By the conditions of the theorem, there exists a \( Q \)-quasi-isometrical homeomorphism \( \varphi : D \to D' \) of the embedding domain \( D \) onto the domain \( D' \). For any function \( u \in W^1_p(D', w) \) the composition \( u \circ \varphi \) is weakly differentiable in the domain \( D \), and the following estimate is correct:
\[
\| u \circ \varphi \|_{W^1_q(D)} = \left( \int_D |u \circ \varphi|^q \, dx \right)^{\frac{1}{q}} + \left( \int_D |\nabla (u \circ \varphi)|^q \, dx \right)^{\frac{1}{q}} \\
\leq \left( \int_D |u \circ \varphi|^q (|J(x, \varphi)| w(\varphi(x)))^{\frac{r}{\varphi}} \frac{1}{(|J(x, \varphi)| w(\varphi(x)))^{\frac{1}{\varphi}}} \, dx \right)^{\frac{1}{q}} \\
+ \left( \int_D |\nabla u|^q (|J(x, \varphi)| w(\varphi(x)))^{\frac{r}{\varphi}} \frac{1}{(|J(x, \varphi)| w(\varphi(x)))^{\frac{1}{\varphi}}} \, dx \right)^{\frac{1}{q}}.
\]
By the Hölder inequality,
\[ \|u \circ \varphi \|_{W^1_q(D)} \]
\[ \leq \left( \int_D \left( \frac{1}{|J(x, \varphi)| w(\varphi(x))} \right)^{\frac{q}{nq}} \, dx \right)^{\frac{nq}{q}} \left( \int_D |u|^p |\varphi(x)| w(\varphi(x)) |J(x, \varphi)| \, dx \right)^{\frac{1}{p}} \]
\[ + \left( \int_D \left( \frac{|u|}{|J(x, \varphi)| w(\varphi(x))} \right)^{\frac{q}{nq}} \, dx \right)^{\frac{nq}{q}} \left( \int_D |\nabla u|^p |\varphi(x)| w(\varphi(x)) |J(x, \varphi)| \, dx \right)^{\frac{1}{p}}. \]

Since \( \varphi \) is a \( Q \)-quasi-isometrical homeomorphism, then by the change of variable formula for the Lebesgue integral we obtain

\[ \|u \circ \varphi \|_{W^1_q(D)} \leq Q^\frac{1}{p} \left( \int_{D'} w(y) \, dy \right)^{\frac{1}{p}} \left( \int_{D'} |u|^p w(y) \, dy \right)^{\frac{1}{p}} \]
\[ + Q^\frac{nq}{p} \left( \int_{D'} w(y) \, dy \right)^{\frac{nq}{p}} \left( \int_{D'} |u|^p w(y) \, dy \right)^{\frac{1}{p}} \]
\[ \leq Q^\frac{n}{p} K(w) \|u \|_{L_p(D', w)} + Q^\frac{nq}{p} K(w) \|
abla u \|_{L_p(D'w)}. \]

By the previous inequality the composition operator
\[ \varphi^*: W^1_p(D', w) \to W^1_q(D), \quad 1 \leq q \leq +\infty, \]
is bounded.

Let us prove boundedness of the composition operator \((\varphi^{-1})^*: L_r(D) \to L_s(D', w)\). By the theorem's conditions the quantity \(\|w^\frac{p}{q} \|_{L_{\frac{1}{pq}}(D')}\) is finite. Hence by [15] the composition operator
\[ (\varphi^{-1})^*: L_r(D) \to L_s(D', w), \quad 1 \leq s \leq r < +\infty, \]
is bounded.

Because \( D \) is an embedding domain the embedding operator \(i: W^1_q(D) \hookrightarrow L_r(D)\) is compact for any \( r < nq/(n-q) \) and bounded for \( r = nq/(n-q) \). Therefore the embedding operator \(i': W^1_p(D', w) \hookrightarrow L_s(D', w)\) is compact (bounded) as a composition of bounded operators \(\varphi^*, (\varphi^{-1})^*\) and the compact (bounded) embedding operator \(i\) for any \( r < nq/(n-q) \) \((r = nq/(n-q))\).

In a similar way we can prove

**Theorem 4.** Let \( D' \subset \mathbb{R}^n \) be a quasi-isometrical image of an embedding domain \( D, \quad 1 \leq s \leq r < nq/(n-q), \quad q \leq p, \quad 1 < p < \infty, \) and
\[ K(w) = \|w^\frac{p}{q} \|_{L_{\frac{1}{pq}}(D')} < +\infty. \]
Then the embedding operator
\[ i: W^1_p(D') \hookrightarrow L_s(D', w) \]
is compact.

For \( r = nq/(n-q) \) the embedding operator \(i\) is bounded only.

The next lemma allows us to construct various examples of the embedding domains.
Lemma 2. Let $D_1$ and $D_2$ be domains such that the embedding operators
\[
\begin{align*}
i : W^1_p(D_1, w) &\hookrightarrow L^s(D_1, v), \\
i : W^1_p(D_2, w) &\hookrightarrow L^s(D_2, v)
\end{align*}
\]
are compact. Then the embedding operator
\[
i : W^1_p(D_1 \cup D_2, w) \hookrightarrow L^s(D_1 \cup D_2, v)
\]
is also compact.

Proof. We prove this lemma by the scheme suggested in [10]. Choose a sequence of functions \( \{f_n\} \subset W^1_p(D_1 \cup D_2, w) \) such that \( \|f_n \| W^1_p(D_1 \cup D_2, w) \leq 1 \) for all \( n \). Let \( g_n = f_n|_{D_1} \) and \( h_n = f_n|_{D_2} \). Then \( g_n \in W^1_p(D_1) \), \( h_n \in W^1_p(D_2) \), \( \|f_n \| W^1_p(D_1) \leq 1 \), \( \|h_n \| W^1_p(D_2) \leq 1 \).

Because the embedding operator \( i : W^1_p(D_1, w) \hookrightarrow L^s(D_1, v) \) is compact, we can choose a subsequence \( \{g_{n_k}\} \) of the sequence \( \{g_n\} \) which converges in \( L^s(D_1, v) \) to a function \( g_0 \in L^s(D_1, v) \). Because the second embedding operator \( i : W^1_p(D_2, w) \hookrightarrow L^s(D_2, v) \) is also compact we can choose a subsequence \( \{h_{n_k}\} \) of the sequence \( \{h_n\} \) which converges in \( L^s(D_2, v) \) to a function \( h_0 \in L^s(D_2, v) \). It is evident that \( g_0 = h_0 \)-almost everywhere in \( D_1 \cap D_2 \) and the function \( f_0 = g_0 |_{D_1} \) and \( f_0 = h_0 \) on \( D_2 \) belongs to \( L^s(D_1 \cup D_2, v) \).

Hence
\[
\|f_{n_k} - f_0 \| L^s(D_1 \cup D_2, v) \leq \|g_{n_k} - g_0 \| L^s(D_1, v) + \|h_{n_k} - h_0 \| L^s(D_2, v).
\]
Therefore \( \|f_{n_k} - f_0 \| L^s(D_1 \cup D_2, v) \rightarrow 0 \) for \( m \rightarrow \infty \). \hfill \Box

3. Embedding operators for general domains

Let \( D \) and \( D' \) be domains in Euclidean space \( \mathbb{R}^n \), \( n \geq 2 \). Remember that a homeomorphism \( \varphi : D \to D' \) belongs to the Sobolev class \( W^1_{1, loc}(D) \) if its coordinate functions belong to \( W^1_{1, loc}(D) \). Denote by \( D\varphi \) the weak differential of \( \varphi \). The norm \( |D\varphi(x)| \) is the standard norm of the linear operator defined by \( D\varphi(x) \).

Call a homeomorphism \( \varphi : D \to D' \) \( w \)-weighted \((p, q)\)-quasiconformal if \( \varphi \) belongs to the Sobolev space \( W^1_{1, loc}(D) \), \( |D\varphi| = 0 \) almost everywhere on the set \( Z = \{x : |J(x, \varphi)|^q|w(\varphi(x))| = 0\} \) and the following inequality
\[
K_{p,q}(D, w) = \left[ \int_D \left( \frac{|D\varphi(x)|^p}{|J(x, \varphi)|^q|w(\varphi(x))|} \right)^\frac{1}{p-q} \, dx \right]^\frac{p-q}{p} < \infty
\]
is correct.

For \( w \equiv 1 \) we call a 1-weighted \((p, q)\)-quasiconformal homeomorphism a \((p, q)\)-quasiconformal one.

The following result was proved in [19] for a more general class of mappings. For the reader’s convenience we reproduce here a simple version of the proof adopted to homeomorphisms.

Proposition 1. Let \( D \) and \( D' \) be domains in Euclidean space \( \mathbb{R}^n \), \( n \geq 2 \) and let \( \varphi : D \to D' \) be a \( w \)-weighted \((p, q)\)-quasiconformal homeomorphism. Then a composition operator
\[
\varphi^* : L^p_p(D', w) \to L^q_q(D), \quad 1 \leq q \leq p < +\infty,
\]
is bounded.
Proof. Let \( f \in L^1_p(D', w) \) be a smooth function. Then \( f \circ \varphi \in L^1_{1,loc}(D) \) and the following inequalities

\[
\| \varphi^* f | L^1_q(D) \| = \left( \int_D |\nabla (f \circ \varphi)|^q \, dx \right)^{1/q} \leq \left( \int_D |D\varphi|^q |\nabla f|^q \, dx \right)^{1/q}
\]

\[
\leq \left( \int_D |D\varphi|^q \frac{1}{|J(x, \varphi)|^s w(\varphi(x))} |\nabla f|^q |J(x, \varphi)|^\frac{s}{p} w(\varphi(x))^{\frac{s}{p}} \, dx \right)^{\frac{1}{q}}
\]

are correct.

Using the H"older inequality and the change of variable formula for the Lebesgue integral, we obtain

\[
\| \varphi^* f | L^1_q(D) \| 
\leq \left[ \int_D \left( \frac{|D\varphi(x)|^p}{|J(x, \varphi)|^s w(\varphi(x))} \right)^{\frac{q}{p-q}} \, dx \right]^{\frac{p-q}{q}} \left( \int_D |\nabla f|^q |J(x, \varphi)|^s w(\varphi(x)) \, dx \right)^{\frac{1}{q}}
\]

\[
= K_{p,q}(D, w) \| f | L^1_p(D', w) \|.
\]

The fulfillment of the last inequality for an arbitrary function \( f \in L^1_p(D', w) \) can be proved by an approximation of \( f \) by smooth functions \([19]\). \qed

The next theorem gives a sufficient condition for the boundedness (compactness) of embedding operators in nonsmooth domains.

**Theorem 5.** Let a domain \( D \subset \mathbb{R}^n \) be an embedding domain and let there exist a \( w \)-weighted \((p, q)\)-quasiconformal homeomorphism \( \varphi : D \to D' \) of the domain \( D \) onto the bounded domain \( D' \).

If for some \( p \leq s \leq r < \infty \) the following inequality is correct,

\[
\int_D \left( |J(x, \varphi)| w(\varphi(x)) \right)^{\frac{r}{d}} \, dx < +\infty,
\]

then an embedding operator

\[
i : W^1_p(D', w) \hookrightarrow L_s(D', w)
\]

is bounded, if \( s \leq r \leq nq/(n-q) \), and is compact if \( s \leq r < nq/(n-q) \).

Proof. Because

\[
\int_D \left( |J(x, \varphi)| w(\varphi(x)) \right)^{\frac{r}{d}} \, dx < +\infty,
\]

the composition operator \((\varphi^{-1})^* : L_r(D) \to L_s(D', w)\) is bounded; i.e., the following inequality

\[
\|(\varphi^{-1})^* v | L_s(D', w)\| \leq A_{r,s}(D, w) \| v | L_r(D)\|
\]

is correct. Here \( A_{r,s}(D, w) \) is a positive constant.

Because the domain \( D \) is an embedding domain and the composition operators

\[
(\varphi^{-1})^* : L_r(D) \to L_s(D', w), \quad \varphi^* : L^1_p(D', w) \to L^1_q(D)
\]
are bounded, the following inequalities
\[
\inf_{c \in \mathbb{R}} \|u - c | L_s(D', w)\| \leq A_{r,s}(D, w) \inf_{c \in \mathbb{R}} \|v - c | L_r(D)\|
\]
\[
\leq A_{r,s}(D, w)M\|v | L_q^1(D)\| \leq A_{r,s}(D, w)K_{p,q}(D, w)M\|u | L_q^1(D', w)\|
\]
hold. Here \(M\) and \(K_{p,q}(D, w)\) are positive constants.

The Hölder inequality implies the following estimate:
\[
|c| = w(D')^{-\frac{1}{p}}\|c | L_p(D', w)\| \leq w(D')^{-\frac{1}{p}}(\|u | L_p(D', w)\| + \|u - c | L_p(D', w)\|)
\]
\[
\leq w(D')^{-\frac{1}{p}}\|u | L_p(D', w)\| + w(D')^{-\frac{1}{p}}\|u - c | L_s(D', w)\|.
\]

Because \(q \leq r\) we have
\[
\|v | L_q(D)\| \leq \|c | L_q(D)\| + \|v - c | L_q(D)\| \leq \|c | D\|^{-\frac{1}{p}} + \|D\|^{-\frac{1}{p}}\|v - c | L_r(D)\|
\]
\[
\leq \left( w(D')^{-\frac{1}{p}}\|u | L_p(D', w)\| + w(D')^{-\frac{1}{p}}\|u - c | L_s(D', w)\| \right)\|D\|^{-\frac{1}{p}}
\]
\[
+ \|D\|^{-\frac{1}{p}}\|v - c | L_r(D)\|.\]

From previous inequalities we obtain finally
\[
\|v | L_q(D)\| \leq \|D\|^{-\frac{1}{p}} w(D')^{-\frac{1}{p}}\|u | L_p(D')\|
\]
\[
+ A_{r,s}(D, w)K_{p,q}(D, w)M\|D\|^{-\frac{1}{p}}w(D')^{-\frac{1}{p}}\|u | L_q^1(D', w)\|
\]
\[
+ K_{p,q}(D, w)M\|D\|^{-\frac{1}{p}}\|u | L_q^1(D', w)\|.
\]

Therefore the composition operator 
\[
\varphi^* : W_p^1(D', w) \rightarrow W_q^1(D)
\]
is also bounded.

Finally we can conclude that the embedding operator \(i : W_p^1(D', w) \hookrightarrow L_s(D', w)\)
is bounded as the composition of bounded operators \(\varphi^*, (\varphi^{-1})^*\) and the embedding operator \(W_q^1(D) \hookrightarrow L_r(D)\) in the case \(r \leq nq/(n - q)\). The embedding operator \(i : W_p^1(D', w) \hookrightarrow L_s(D', w)\) is compact as the composition of bounded operators \(\varphi^*, (\varphi^{-1})^*\) and the embedding operator \(W_q^1(D) \hookrightarrow L_r(D)\) is compact in the case \(r < nq/(n - q)\).

\[
\square
\]

Let us apply these general results to domains with anisotropic Hölder singularities described in [9].

Let \(\gamma_i \geq 1, 0 \leq \tau \leq 1\). For the function \(G = \prod_{i=1}^{n-1} g_i\) denote by
\[
\gamma = \frac{\log G(\tau)}{\log \tau} + 1.
\]

It is evident that \(\gamma \geq n\). Let us consider the domain
\[
H_y = \{x \in \mathbb{R}^n : 0 < x_n < 1, 0 < x_i < g_i(x_n), i = 1, 2, \ldots, n - 1\}.
\]

In the case \(g_1 = g_2 = \cdots = g_{n-1}\) we will say that the domain \(H_y\) is a domain with \(\sigma\)-Hölder singularity, \(\sigma = (\gamma - 1)/(n - 1)\). For \(g_1(\tau) = g_2(\tau) = \cdots = g_{n-1}(\tau) = \tau\) we will use the notation \(H_1\) instead of \(H_y\). The domain \(H_1\) is quasi-isometrically homeomorphic to the standard unit ball. Hence by Theorem 3, domain \(H_1\) is an embedding domain.
If the weight is polynomial, i.e. \( w(x) := |x|^\alpha \), then the \( A_p \)-condition is correct only if \( -n < \alpha < n(p-1) \).

**Theorem 6.** Let \( -n < \alpha < n(p-1) \) and \( 1 < p < \alpha + \gamma \). Then the embedding operator

\[
W_p^{1} (H_g, |x|^\alpha) \hookrightarrow L_s(H_g, |x|^\alpha)
\]

is compact for any \( 1 \leq s < \frac{(\alpha+\gamma)p}{\alpha+\gamma-p} \).

**Proof.** For any \( 0 < a < 1 \) we define a homeomorphism \( \varphi_a : H_1 \to H_g, \ a > 0 \), by the expression

\[
\varphi_a(x) = \left( \frac{x_1}{a}, \ldots, \frac{x_n}{a} \right) = (g_1^a(x_n), \ldots, g_{n-1}^a(x_n), x_n^a).
\]

During the proof we will choose a number \( a \) and a corresponding homeomorphism in such a way that the conditions of Theorem 5 will be fulfilled. By a simple calculation,

\[
\frac{\partial(\varphi_a)}{\partial x_i} = g_i^a(x_n), \quad \frac{\partial(\varphi_a)}{\partial x_n} = -\frac{x_n g_i^a(x_n)}{x_n^2} + \frac{ax_n g_i^{a-1}(x_n)}{x_n} g_i^a(x_n)
\]

and

\[
\frac{\partial(\varphi_a)}{\partial x_n} = ax_n^{a-1}
\]

for any \( i = 1, \ldots, n-1 \).

Hence \( J(x, \varphi_a(x)) = ax_n^{a-n}G^a(x_n) \). By definition, the functions \( g_i, i = 1, 2, \ldots, n-1 \) are Lipschitz functions. Therefore there exists a constant \( M < +\infty \) such that

\[
g_i(x_n) \leq M x_n \quad \text{and} \quad g_i^a(x_n) \leq M
\]

for any \( x_n \in [0, 1] \) and \( i = 1, 2, \ldots, n-1 \). Using estimates for derivatives and the inequalities \( x_i \leq x_n \) that are correct for all \( x \in H_1 \) we obtain the following estimate:

\[
|D\varphi_a(x)| \leq c_1 x_n^{a-1}.
\]

By the same way we obtain also the two-sided estimate:

\[
c_2 x_n^{a} \leq |\varphi_a(x)|^{\alpha} \leq c_3 x_n^{a}.
\]

Now we can check for which \( q \) the homeomorphism \( \varphi_a : H_1 \to H_g \) is a \( w \)-weighted \((p,q)\)-quasiconformal homeomorphism:

\[
I_a = K_{p,q}(H_1, w)^{\frac{a\alpha}{p-q}} = \int_{H_1} \left( \frac{|D\varphi_a(x)|^{p}}{|J(x, \varphi_a)|^{\alpha} |w(\varphi_a(x))|^{\alpha}} \right)^{\frac{1}{p-q}} dx
\]

\[
\leq C \int_{0}^{1} \cdots \int_{0}^{1} \left( x_n^{p(a-1)-a(a+1)+n} G^{a-n} G^a(x_n) x_n \right) dx_1 \cdots dx_{n-1} dx_n
\]

\[
= C \int_{0}^{1} \frac{p(a-1)-a(a+1)+n}{p-q} + n - a(\gamma - 1) \frac{q}{p} + q \ G^{-a-n}(x_n) dx_n.
\]

Hence the quantity \( I_a \) is finite if

\[
(p(a-1)-a(a+1)+n) \frac{q}{p-q} + n - a(\gamma - 1) \frac{q}{p-q} > 0
\]

or

\[
q < np/(a(\alpha + \gamma) + p - ap).
\]

Hence, the homeomorphism \( \varphi_a \) is a \( w \)-weighted \((p,q)\)-quasiconformal homeomorphism.
Let us check the conditions of Theorem 5. First we have to estimate the degree of integrability for the Jacobian $J_a$ of the homeomorphism $\varphi_a$:

\[
J_a = \int \left( |J(x, \varphi)|w(\varphi(x)) \right)^{\frac{1}{r-s}} dx
\]

\[
\leq C \int_0^1 \int_0^1 \ldots \int_0^1 \frac{a(a+1)-n}{x_n} G^{\frac{a}{r-s}}(x_n) dx_1 \ldots dx_{n-1} dx_n
\]

\[
\leq C \int_0^1 \frac{a(a+1)-n}{x_n+n-1+a\gamma(\gamma-1)} dx_n.
\]

The integral $J_a$ converges if

\[
(a(a+1) - n) \frac{r}{r-s} + n + a \frac{r}{r-s} (\gamma - 1) > 0,
\]

or

\[
s < \frac{a(\alpha + \gamma)}{n} r.
\]

Hence, the conditions of Theorem 5 are fulfilled if

\[
s < \frac{a(\alpha + \gamma)}{n} r, \quad r < \frac{nq}{n-q} \quad \text{and} \quad q < \frac{np}{a(\alpha + \gamma) + p - ap}.
\]

Therefore

\[
s < \frac{a(\alpha + \gamma) nq}{n - q} < \frac{np}{a(\alpha + \gamma - p)} \frac{a(\alpha + \gamma)}{n} = \frac{p(\alpha + \gamma)}{\alpha + \gamma - p}.
\]

Theorem 6 is proved. \hfill \Box

**Remark 1.** The conclusion of Theorem 6 is fulfilled for functions $g_i : [0, 1] \to \mathbb{R}$, $i = 1, 2, \ldots, n-1$ such that

\[
C_1 \tau^{\gamma_i} \leq g_i(\tau) \leq C_2 \tau^{\gamma_i}
\]

for some constants $C_1$ and $C_2$.

From Theorem 6, Corollary 2 immediately follows.

**Corollary 2.** Let $D \subseteq \mathbb{R}^n$ be a domain with $\sigma$-Hölder singularity. Then the embedding operator

\[
W^1_p(D, |x|^\alpha) \hookrightarrow L_s(D, |x|^\alpha)
\]

is compact for

\[
s \leq \frac{(\sigma(n-1) + 1 + \alpha)p}{\sigma(n-1) + \alpha - (p-1)}.
\]

(Here $s \geq 0$, since $p < \alpha + \gamma$, $\sigma = (\gamma - 1)/(n-1)$.)

Let us compare this result with the known ones. From the main result of [7] it follows that for an arbitrary domain $D$ with $\sigma$-Hölder singularity the embedding operator

\[
W^1_p(D, |x|^\alpha) \hookrightarrow L_s(D, |x|^\alpha)
\]
is bounded, while

\[ \tilde{s} \leq \frac{(n + \alpha)p}{\sigma(n \alpha + n - 1) - (p - 1)} \].

Then \( s > \tilde{s} \) while \( \sigma > 1 \), and \( s = \tilde{s} \) while \( \sigma = 1 \). Hence our estimate is sharper.

The next results deal with embeddings of classical Sobolev spaces into weighted Lebesgue spaces.

**Theorem 7.** Let \( D \subset \mathbb{R}^n \) be an embedding domain and let there exist a \((p, q)\)-quasiconformal homeomorphism \( \varphi \) of \( D \) onto the bounded domain \( D' \).

If

\[ \int_D \left( |J(x, \varphi)|w(\varphi(x)) \right)^{\frac{\tilde{s}}{s}} < +\infty, \]

for a pair of numbers \( p \leq s < r < \infty \), then an embedding operator

\[ i : W^1_p(D') \hookrightarrow L_s(D', w) \]

is compact for \( r < nq/(n - q) \) and is bounded for \( r = nq/(n - q) \).

**Proof.** Because \( D \) is an embedding domain, the \((p, q)\)-quasiconformal homeomorphism \( \varphi \) induces the bounded composition operator

\[ \varphi^* : W^1_p(D') \to W^1_q(D) \]

(see [18]).

Because \( \int_D \left( |J(x, \varphi)|w(\varphi(x)) \right)^{\frac{\tilde{s}}{s}} < +\infty \) the composition operator for Lebesgue spaces

\[ \| (\varphi^{-1})^*v \|_{L_s(D', w)} \leq A_{r, s}(D, w) \| v \|_{L_r(D)} \]

is bounded also.

Finally we can conclude that

1) If \( r \leq nq/(n - q) \), then the embedding operator \( i : W^1_p(D') \hookrightarrow L_s(D', w) \) is bounded as a composition of bounded operators \( \varphi^*, (\varphi^{-1})^* \) and the bounded embedding operator \( W^1_p(D) \hookrightarrow L_r(D) \).

2) If \( r < nq/(n - q) \), then the embedding operator \( i : W^1_p(D') \hookrightarrow L_s(D', w) \) is compact as a composition of bounded operators \( \varphi^*, (\varphi^{-1})^* \) and the compact embedding operator \( W^1_p(D) \hookrightarrow L_r(D) \).

Apply the previous result to anisotropic Hölder domains. \( \square \)

**Theorem 8.** Let \( 1 < p < \gamma \) and \( 1 \leq s < \frac{(\alpha + \gamma)p}{\gamma - p} \). Then the embedding operator

\[ W^1_p(H_g) \hookrightarrow L_s(H_g, |x|^\alpha) \]

is compact.

**Proof.** Similar to the proof of Theorem 6, for any \( 0 < a < 1 \), we define a homeomorphism \( \varphi_a : H_1 \to H_g, a > 0 \) by the expression

\[ \varphi_a(x) = (\frac{x_1}{x_n} g^a_1(x_n), \ldots, \frac{x_{n-1}}{x_n} g^a_{n-1}(x_n), x_n). \]

During the proof we will choose a number \( a \) and the corresponding homeomorphism in such a way that the conditions of Theorem 7 will be fulfilled.
Hence, the homeomorphism

\[ J(x, \varphi_a(x)) = ax_n^{a-n} G^a(x_n). \]

By a simple calculation we have

\[
\frac{\partial(\varphi_a)}{\partial x_i} = \frac{g_a(x_n)}{x_n}, \quad \frac{\partial(\varphi_a)}{\partial x_n} = -x_i g_a^0(x_n) + \frac{a x_i g_a^{i-1}(x_n)}{x_n} g'_1(x_n) \quad \text{and} \quad \frac{\partial(\varphi_a)}{\partial x_n} = ax_n^{a-1}
\]

for any \( i = 1, \ldots, n-1 \).

Hence \( J(x, \varphi_a(x)) \) is \( a \) quasiconformal homeomorphism. Let us start from the following estimate:

\[
|D\varphi_a(x)| \leq \sum_{i=1}^n |x_i| = Mx_n \quad \text{and} \quad g'_1(x_n) \leq M
\]

for any \( x_n \in [0,1] \) and \( i = 1, 2, \ldots, n-1 \). Using estimates for derivatives and the inequalities \( x_i \leq x_n \) that are correct for all \( x \in H_1 \) we obtain the following estimate: \( |D\varphi_a(x)| \leq c_1 x_n^{a-1} \). In the same way we obtain also the two-sided estimate

\[
c_2 x_n^a \leq |\varphi_a(x)|^a \leq c_3 x_n^a.
\]

Now we can check for which \( q \) the homeomorphism \( \varphi_a : H_1 \to H_g \) is a \((p,q)\)-quasiconformal homeomorphism. Let us start from the following estimate:

\[
I_a = K_{p,q}(H_1) \frac{a^n}{q} = \int_{H_1} \left( \frac{|D\varphi_a(x)|^p}{|J(x, \varphi_a)|^q} \right)^{\frac{1}{q}} dx
\]

\[
\leq C \int_0^1 \frac{x_n}{0} \ldots \int_0^x \left( \frac{x_n^{p(a-1)}}{x_n^{a-n} G^a(x_n)} \right)^{\frac{1}{q}} dx_1 \ldots dx_{n-1} dx_n
\]

\[
= C \int_0^1 x_n^{\frac{(p-1)(a-1)}{p-n}} \frac{a-n}{p-q} + 1 \frac{a-1}{p-q} G^{-a} G^{a} G^{-\frac{a}{p-q}}(x_n) dx_n.
\]

Hence, the quantity \( I_a \) is finite if

\[
(p(a - 1) - a + n) \frac{q}{p-q} + n - a(\gamma - 1) \frac{q}{p-q} > 0
\]

or

\[
q < np/(a\gamma + p - ap).
\]

Hence, the homeomorphism \( \varphi_a \) is a \((p,q)\)-quasiconformal homeomorphism.

Let us check the conditions of Theorem 5. First we have to estimate the degree of integrability for the Jacobian \( J_a \) of the homeomorphism \( \varphi_a \):

\[
J_a = \int_{H_1} \left( |J(x, \varphi)| w(\varphi(x)) \right)^{\frac{1}{q}} dx
\]

\[
\leq C \int_0^1 x_n \ldots \int_0^x x_n^{a(a+1)-n} \frac{a-n}{r-s} + \frac{a}{r-s} \frac{1}{(r-s) \gamma - 1} dx_1 \ldots dx_{n-1} dx_n
\]

\[
\leq C \int_0^1 x_n \frac{(a(a+1)-n)}{r-s} + n-1 + \frac{1}{r-s} \frac{a}{(r-s)(\gamma - 1)} dx_n.
\]
The integral $J_a$ converges if
\[
(a(\alpha + 1) - n) \frac{r}{r-s} + n + a \frac{r}{r-s} (\gamma - 1) > 0,
\]
or
\[
s < \frac{a(\alpha + \gamma)}{n} r.
\]

Hence, the conditions of Theorem 5 are fulfilled if
\[
s < \frac{a(\alpha + \gamma)}{n} r, \quad r < \frac{\alpha q}{n - q} \quad \text{and} \quad q < \frac{np}{a(\gamma + p - ap)}.
\]

Therefore
\[
s < \frac{a(\alpha + \gamma)}{n} \frac{\alpha q}{n - q} \frac{np}{a(\gamma + p - ap)} = \frac{p(\alpha + \gamma)}{\gamma - p}.
\]

\[\square\]

4. SOBOLEV EMBEDDINGS FOR SPACES WITH HIGH DERIVATIVES

This section is devoted to embedding theorems for weighted Sobolev spaces with high derivatives.

If for some $m$ and $p$ an embedding theorem for classical Sobolev spaces $W^m_p$ is correct, then, using a standard procedure, it is possible to obtain the corresponding embedding theorem for $m_1 \geq m$ and $p_1 \geq p$ also (see, for example, [9]). Here we adopt the scheme of [9] to the case of weighted Sobolev spaces. The next lemma is the main technical result of this section.

**Lemma 3.** Let $D$ be a domain in $\mathbb{R}^n$. Suppose that for some $p_0 \geq 1$ and $q_0 \geq 1$ the embedding operator
\[
W^1_{p_0}(D, w) \hookrightarrow L_{q_0}(D, w)
\]
is bounded. Let $p \geq p_0$ and $\frac{1}{p} > \frac{1}{p_0} - \frac{1}{q_0}$. If $q$ is such that
\[
\frac{1}{p} - \frac{1}{q} = \frac{1}{p_0} - \frac{1}{q_0},
\]
then the embedding operator
\[
W^1_p(D, w) \hookrightarrow L_q(D, w)
\]
is bounded also.

**Proof.** Let a function $u$ belong to the space $W^1_p(D, w) \cap C^\infty_0(D)$. Using boundedness of the embedding operator
\[
W^1_{p_0}(D, w) \hookrightarrow L_{q_0}(D, w)
\]
we obtain the following estimate:
\[
\left( \int_D |u|^q w(x) \, dx \right)^{\frac{1}{q}} = \left( \int_D (|u|^{q_0} w(x) \, dx \right)^{\frac{1}{q_0}}
\]
\[
\leq C \left( \left( \int_D |\nabla (u^{\frac{q}{q_0}}) |^{p_0} w(x) \, dx \right)^{\frac{1}{p_0}} + \left( \int_D (|u|^{q_0} w(x) \, dx \right)^{\frac{1}{q_0}} \right)
\]
\[
\leq C \left( \left( \int_D |u|^{p_0 \frac{q-q_0}{q_0}} |\nabla u|^{p_0} w(x) \, dx \right)^{\frac{1}{p_0}} + \left( \int_D |u|^{p_0 \frac{q-q_0}{q_0}} |u|^{p_0} w(x) \, dx \right)^{\frac{1}{p_0}} \right).
\]
Applying the Hölder inequality we get
\[
\left( \int_D |u|^q w(x) \, dx \right)^{\frac{1}{q}} \leq C \left( \left( \int_D |\nabla u|^p w(x) \, dx \right)^{\frac{1}{p}} \cdot \left( \int_D |u|^{pp_0 \frac{q-q_0}{n_0(p-p_0)} w(x) \, dx \right)^{\frac{p-p_0}{pp_0}} \right)
\]
\[+ \left( \int_D |u|^p w(x) \, dx \right)^{\frac{1}{p}} \cdot \left( \int_D |u|^{pp_0 \frac{q-q_0}{n_0(p-p_0)} w(x) \, dx \right)^{\frac{p-p_0}{pp_0}} \right).
\]
Because \( q = pp_0 \frac{q-q_0}{n_0(p-p_0)} \), we obtain finally
\[
\left( \int_D |u|^q w(x) \, dx \right)^{\frac{1}{q}} \leq C \left( \left( \int_D |\nabla u|^p w(x) \, dx \right)^{\frac{1}{p}} + \left( \int_D |u|^p w(x) \, dx \right)^{\frac{1}{p}} \right) \cdot \left( \int_D |u|^q w(x) \, dx \right)^{\frac{p-p_0}{pp_0}}.
\]
Since \( \frac{1}{q_0} - \frac{p-p_0}{pp_0} = \frac{1}{q} \) then
\[
\|u | L_q(D, w)\| \leq C\|u | W_p^1(D, w)\|.
\]
The lemma is proved.

Denote
\[q_{m,D}(p) = \sup \{ q \in \mathbb{R}^+ : \text{the operator } W_p^m(D, w) \hookrightarrow L_q(D, w) \text{ is bounded} \}.
\]
The following statements can be obtained directly from Lemma 3.

**Corollary 3.** If \( D \) is a bounded domain in \( \mathbb{R}^n \), \( p \geq p_0 \), then
\[q_{1,D}^* (p) \geq \frac{pp_0 q_{1,D}^*(p_0)}{p_0 q_{1,D}^*(p_0) - p(q_{1,D}^*(p_0) - p_0)}.
\]

**Corollary 4.** If \( D \) is a bounded domain in \( \mathbb{R}^n \), \( p \geq p_0 \) and \( m > 1 \), then
\[q_{m,D}^* (p) \geq \frac{pp_0 q_{1,D}^*(p_0)}{p_0 q_{1,D}^*(p_0) - mp(q_{1,D}^*(p_0) - p_0)}.
\]

**Proof.** This corollary follows from the previous corollary by induction with respect to \( m \).

Combining Theorem 5 and Corollary 4 we obtain finally

**Theorem 9.** Let domain \( D \subset \mathbb{R}^n \) be an embedding domain and let there exist a \( w \)-weighted \((p,q)\)-quasiconformal homeomorphism \( \varphi : D \to D' \) of the domain \( D \) onto the bounded domain \( D' \).

If for some \( s \leq r \leq \frac{mq}{(n-q)} \) the following inequality is correct,
\[
\int_D \left( \left| J(x, \varphi) \right| w(\varphi(x)) \right) ^{\frac{1}{r}} < +\infty,
\]
then an embedding operator
\[i : W_p^m(D', w) \hookrightarrow L_{s^*}(D', w)
\]
is bounded if
\[ s^* \geq \frac{ps}{s - m(s - p)} \]

5. Solvability of degenerate elliptic equations

In this section we apply an embedding theorem for Hilbert Sobolev spaces \( W_2^1 \) to a degenerate elliptic boundary problem.

**Theorem 10.** Let \( D' \subset \mathbb{R}^n \) be a quasi-isometrical image of an embedding domain \( D \) and

\[
\int_{D'} w(y)^{-\frac{p}{2}} \, dy < +\infty.
\]

Then an embedding operator

\[ i' : W_2^1(D', w) \hookrightarrow L_2(D') \]

is bounded.

**Proof.** By the conditions of the theorem there exists a \( Q \)-quasi-isometrical homeomorphism \( \varphi : D \to D' \) of the embedding domain \( D \) onto \( D' \). For any function \( u \in W_2^1(D', w) \) the composition \( u \circ \varphi \) is weakly differentiable in the domain \( D \), and the following estimates are correct for any \( 1 \leq q \leq 2 \):

\[
\| u \circ \varphi | W_q^1(D) \| = \left( \int_D |u \circ \varphi|^q \, dx \right)^{\frac{1}{q}} + \left( \int_D |\nabla (u \circ \varphi)|^q \, dx \right)^{\frac{1}{q}}
\]

\[
\leq \left( \int_D |u \circ \varphi|^q |J(x, \varphi)| w(\varphi(x))^\frac{q}{2} \frac{1}{|J(x, \varphi)| w(\varphi(x))^\frac{q}{2}} \, dx \right)^{\frac{1}{q}}
\]

\[
+ \left( \int_D |\nabla u|^q |\varphi'(x)|^q |J(x, \varphi)| w(\varphi(x))^\frac{q}{2} \frac{1}{|J(x, \varphi)| w(\varphi(x))^\frac{q}{2}} \, dx \right)^{\frac{1}{q}}.
\]

By the Hölder inequality we have

\[
\| u \circ \varphi | W_q^1(D) \|
\]

\[
\leq \left( \int_D \left( \frac{1}{|J(x, \varphi)| w(\varphi(x))} \right)^{\frac{2q}{q-2}} \, dx \right)^{\frac{q-2}{2q}} \left( \int_D |u|^2(\varphi(x)) w(\varphi(x)) |J(x, \varphi)| \, dx \right)^{\frac{1}{2}}
\]

\[
+ \left( \int_D \left( \frac{|\varphi'(x)|^2}{|J(x, \varphi)| w(\varphi(x))} \right)^{\frac{2q}{q-2}} \, dx \right)^{\frac{q-2}{2q}} \left( \int_D |\nabla u|^2(\varphi(x)) |\varphi'(x)| w(\varphi(x)) |J(x, \varphi)| \, dx \right)^{\frac{1}{2}}.
\]
Since \( \varphi \) is the \( Q \)-quasi-isometrical homeomorphism, then by the change of variable formula in the Lebesgue integral, we obtain

\[
\| u \circ \varphi \|_{W^1_q(D)} \leq Q^{\frac{q}{n}} \left( \int_{D'} w(y)^{\frac{n}{n-q}} \, dy \right)^{\frac{2}{2-q}} \left( \int_{D'} |u|^2 w(y) \, dy \right)^{\frac{1}{2}} + Q^{\frac{2-q+n}{n}} \left( \int_{D'} w(y)^{\frac{n}{n-q}} \, dy \right)^{\frac{2}{2-q}} \left( \int_{D'} |\nabla u|^p w(y) \, dy \right)^{\frac{1}{p}} = Q^{\frac{q}{n}} K(w) \| u \|_{L^2(D', w)} + Q^{\frac{2-q+n}{n}} K(w) \| \nabla u \|_{L^p(D'w)}.
\]

By the previous inequality the composition operator

\[
\varphi^* : W^1_2(D', w) \rightarrow W^1_q(D), \quad 1 \leq q \leq 2,
\]
is bounded.

Since \( D \) is an embedding domain there exists the bounded embedding operator

\[
i : W^1_q(D) \hookrightarrow L^{\frac{nq}{n-q}}(D).
\]

Now we choose a number \( q \) such that \( \frac{nq}{n-q} = 2 \) (i.e. \( q = \frac{2n}{n+2} \)).

Since \( \varphi \) is the \( Q \)-quasi-isometrical homeomorphism, the following composition operator acting on Lebesgue spaces,

\[
(\varphi^{-1})^* : L^2(D) \rightarrow L^2(D'),
\]
is bounded also \[18]\.

Therefore the embedding operator \( i' : W^1_2(D', w) \hookrightarrow L^2(D') \) is bounded as a composition of bounded operators \( \varphi^* \), \( (\varphi^{-1})^* \) and the bounded embedding operator \( i \).

Define an inner product in the weighted space \( W^1_2(D, w) \) as:

\[
\langle u, v \rangle = \int_D \nabla u \cdot \nabla v \, w(x) \, dx,
\]
for any \( u, v \in W^1_2(D, w) \).

Consider the Dirichlet problem for the degenerate elliptic equation:

\begin{align}
(1) \quad & \text{div}(w(x) \nabla u) = f, \\
(2) \quad & u|_{\partial D} = 0
\end{align}
in a bounded domain \( D \) for the weight \( w \in C^1(D) \).

**Theorem 11.** Let \( f \in L^2(D) \) and \( \int_D w(y)^{-\frac{n}{n-q}} \, dx < +\infty \). Then there exists a unique weak solution \( u \in W^1_2(D, w) \) of the problem (1), (2).

**Proof.** The function \( f \in L^2(D) \) induces a linear functional \( F : L^2(D) \rightarrow R \) by the standard rule

\[
F(\phi) = \int_D f(x) \phi(x) \, dx.
\]

By Theorem 10 there exists a bounded embedding operator \( i : W^1_2(D, w) \hookrightarrow L^2(D) \).
Therefore

\[ |F(\phi)| \leq \|f \cdot \phi| L_1(D)\| \]

\[ \leq \|f| L_2(D)\| \cdot \|\phi| L_2(D)\| \leq C\|f| L_2(D)\| \cdot \|\phi| W_2^1(D, w)\|. \]

Hence, \( F \) is a bounded linear functional in the Hilbert space \( W_2^1(D, w) \). By the Riesz representation theorem \([20]\) there exists a unique function \( u \in W_2^1(D, w) \) such that

\[ F(\phi) = \langle u, \phi \rangle = \int_D \nabla u \cdot \nabla \phi w(x) dx, \]

or

\[ \int_D \nabla u \cdot \nabla \phi w(x) dx = \int_D f(x) \phi(x) dx. \]

Therefore \( u \) is the unique weak solution of the problem (1), (2). \( \square \)
