IWASAwa decompositions
of some infinite-dimensional Lie groups

Daniel Beltiţă

Abstract. We set up an abstract framework that allows the investigation of
Iwasawa decompositions for involutive infinite-dimensional Lie groups modeled
on Banach spaces. This provides a method to construct Iwasawa decompo-
sitions for classical real or complex Banach-Lie groups associated with the
Schatten ideals $S_p(H)$ on a complex separable Hilbert space $H$ if $1 < p < \infty$.

1. Introduction

Our aim in this paper is to set up an abstract framework that allows us to
investigate Iwasawa decompositions for involutive infinite-dimensional Lie groups
modeled on Banach spaces. In particular we address an old conjecture on the
existence of such decompositions for the classical Banach-Lie groups of operators
associated with the Schatten operator ideals on Hilbert spaces (see subsection 8.4
of Section II.8 in [Ha72] and Section 3 below), and we show that the corresponding
question can be answered in the affirmative in many cases, even in the case of the
covering groups (Corollary 7.2 below). To place these results in a proper perspective, we mention that part of our motivation comes from the problem of describing an appropriate class of infinite-dimensional reductive Lie groups, as discussed in the paper [Be09].

The Iwasawa decompositions of finite-dimensional reductive Lie groups (see, e.g., [Iw49], [He01], and [Kn96]) play a crucial role in areas such as differential geometry and representation theory. So far as differential geometry is concerned, there exists a recent growth of interest in group decompositions and their implications in various geometric problems in infinite dimensions; see, for instance, [Tu05], [Tu06], and the references therein. From this point of view it is natural to try to understand the infinite-dimensional versions of Iwasawa decompositions as well; this problem was already addressed in the case of loop groups in [Ke04] and [BD01]. As regards the representation theory, it is well known that decompositions of this kind are particularly important for instance in the construction of principal series representations, and there has been a continuous endeavor to extend the ideas of representation theory to the setting of infinite-dimensional Lie groups. Some references related in spirit to the present paper are [Se57], [Kl73], [SY75], [Ol78], [Bo80], [Ca83], [Ol88], [Pic90], [Bo93], [Nee93], [NO98], [NRW01], [DPW02], [Nee04], [Gru05], [Wo05], [BR07]; however, this list is very far from being complete. In this connection we wish to highlight the paper [Wo05] devoted to an investigation of direct limits of Iwasawa decompositions and principal series representations of reductive Lie groups. In some sense, the results of the present paper can be thought of as belonging to the same line of investigation, inasmuch as the construction of Iwasawa decompositions should be the very first step toward the construction of principal series representations for the classical Banach-Lie groups and their covering groups.

Another source of interest in obtaining Iwasawa decompositions for infinite-dimensional versions of reductive Lie groups (cf. [Be09]) is related to the place held by reductive structures in the geometry of many infinite-dimensional manifolds; see, for instance, [CG99] and [Nee03]. We refer also to the recent survey [Ga06], which skillfully highlights the special relationship between the reductive structures and the idea of amenability. That relationship also plays an important role in the abstract framework constructed in Section 2 of the present paper. It is noteworthy that reductive structures with a Lie-theoretic flavor constitute the background of the papers [Neu99] and [Neu02] as well, concerning convexity theorems (cf. [Ko73], [LR91], [BFR93]) in an infinite-dimensional setting.

The methods we use to set up the aforementioned abstract framework are largely inspired by the interaction between the theory of Lie algebras and the local spectral theory of bounded operators (see [BS01]). These methods turn out to be particularly effective in order to identify what the third component of an infinite-dimensional Iwasawa decomposition should be, that is, the infinite-dimensional versions of nilpotent Lie groups and algebras.

On the other hand, the applications we make to the classical Banach-Lie groups are naturally related to the theory of triangular integrals ([GK70], [KL72], [Er78], [Ara78], [Da88]) and to the theory of factorization of Hilbert space operators along nests of subspaces (Arv67, GK70, Er72, Lar85, Po86, Pi88, MSS88). For the reader’s convenience we recorded in Appendix A some auxiliary facts on operator ideals, in particular the factorization results suitable for our purposes. We refer to the paper [Be09] for more details.
The structure of the present paper is outlined in the table of contents at the very beginning. Thus, we are going to set up an abstract framework in Section 2, and then in Section 3 we shall recall the classical Banach-Lie groups under a slightly more general form than usual (see [Ha72]). By using the general methods developed in Section 2, we shall investigate in Sections 4–6 the existence of Iwasawa decompositions for the three types of classical groups. Finally, Section 7 contains our main result on such decompositions for all the covering groups of the connected 1-components of classical Banach-Lie groups; see Corollary 7.2.

**Rough decompositions.** Before proceeding with the main part of our investigation which leads to the aforementioned corollary, we wish to show a sample of pathological phenomena one has to avoid in order to obtain smooth Iwasawa decompositions for infinite-dimensional Lie groups.

In the next statement and throughout the paper, by an orthonormal basis in a real or complex Hilbert space we mean a complete orthonormal subset.

**Proposition 1.1.** Let \( \mathcal{H} \) be a complex separable Hilbert space with an orthonormal basis \( \{\xi_j\}_{j<\omega} \), where \( \omega \in \mathbb{N} \cup \{\aleph_0\} \). Consider the Banach-Lie group \( G := \text{GL}(\mathcal{H}) \) consisting of all invertible bounded linear operators on \( \mathcal{H} \), and its subgroups

\[
K := \{k \in G \mid k^*k = 1\},
\]

\[
A := \{a \in G \mid a\xi_j \in \mathbb{R}_+^* \xi_j \text{ whenever } 0 \leq j < \omega\}, \text{ and}
\]

\[
N := \{n \in G \mid n\xi_j \in \xi_j + \text{span}\{\xi_l \mid l < j\} \text{ whenever } 0 \leq j < \omega\}.
\]

In addition, consider the Banach-Lie algebra \( g = \mathcal{B}(\mathcal{H}) \), with its closed Lie subalgebra

\[
\mathfrak{t} := \{X \in g \mid X^* = -X\},
\]

\[
\mathfrak{a} := \{Y \in g \mid Y\xi_j \in \mathbb{R}\xi_j \text{ whenever } 0 \leq j < \omega\}, \text{ and}
\]

\[
\mathfrak{n} := \{Z \in g \mid Z\xi_j \in \text{span}\{\xi_l \mid l < j\} \text{ whenever } 0 \leq j < \omega\}.
\]

Then the following assertions hold:

- \( K, A, \) and \( N \) are Banach-Lie groups with the corresponding Lie algebras \( \mathfrak{t}, \mathfrak{a}, \) and \( \mathfrak{n} \), respectively, and the multiplication map \( m: K \times A \times N \to G, (k,a,n) \mapsto \text{kan} \), is smooth and bijective.

- The mapping \( m \) is a diffeomorphism if and only if \( \mathfrak{t} + \mathfrak{a} + \mathfrak{n} = g \), and this equality holds if and only if the Hilbert space \( \mathcal{H} \) is finite-dimensional.

**Proof.** It is straightforward to prove that \( m \) is injective since \( K \cap AN = \{1\} \). To prove that \( m \) is surjective as well, we can use the unital Banach algebra

\[
\mathcal{B} = \{b \in \mathcal{B}(\mathcal{H}) \mid b\xi_j \in \text{span}\{\xi_l \mid 0 \leq l \leq j\} \text{ if } 0 \leq j < \omega\}.
\]

Denote by \( \mathcal{B}^\times \) the group of invertible elements in \( \mathcal{B} \). It was proved in [Arv75] and [Lar85] that for every \( g \in \text{GL}(\mathcal{H}) \) there exist \( k \in K \) and \( b \in \mathcal{B}^\times \) such that \( g = kb \). It is easy to see that \( \mathcal{B}^\times \subseteq KAN \); hence \( g = kb \in KAN = m(K \times A \times N) \). The fact that \( K, A, N \) are Banach-Lie groups with the corresponding Lie algebras \( \mathfrak{t}, \mathfrak{a}, \) and \( \mathfrak{n} \), respectively, follows for instance by Corollary 3.7 in [Bec00], and in addition the inclusion maps of \( K, A, \) and \( N \) into \( G \) are smooth. It then follows that the multiplication map

\[
m: K \times A \times N \to G
\]

smooth as well.

In order to prove the second assertion note that the tangent mapping

\[
T_{(1,1,1)}m: \mathfrak{t} \times \mathfrak{a} \times \mathfrak{n} \to g
\]
is given by $(X,Y,Z) \mapsto X + Y + Z$; hence $\mathfrak{m}$ is a local diffeomorphism if and only if $\mathfrak{t} + \mathfrak{a} + \mathfrak{n} = \mathfrak{g}$. Since we have already seen that $\mathfrak{m}$ is a bijective map, it follows that the latter direct sum decomposition actually holds if and only if $\mathfrak{m}$ is a diffeomorphism. Next note that if $\dim \mathcal{H} < \infty$, then we get $\mathfrak{t} + \mathfrak{a} + \mathfrak{n} = \mathfrak{g}$ by an elementary reasoning (or by the local Iwasawa decomposition for the complex finite-dimensional reductive Lie algebra $\mathfrak{g}$; see, e.g., [Kn96]).

Thus, to complete the proof, it will be enough to show that if the Hilbert space $\mathcal{H}$ is infinite-dimensional, then $\mathfrak{g} \setminus (\mathfrak{t} + \mathfrak{a} + \mathfrak{n}) \neq \emptyset$. In fact, for $j,l \in \mathbb{N}$ denote $h_{jl} = 0$ if $j = l$ and $h_{jl} = 1/(j-l)$ if $j \neq l$. Then there exists $W \in \mathcal{B}(\mathcal{H})$ whose matrix with respect to the orthonormal basis $\{\xi_j\}_{j \in \mathbb{N}}$ is $(h_{jl})_{j,l \in \mathbb{N}}$, and in addition $W^* = -W$ and there exist no operators $Z_1, Z_2 \in \mathfrak{n}$ with $W = Z_1 - Z_2^*$ (see Example 4.1 in [Da88]). Now it is easy to see that $iW \notin \mathfrak{t} + \mathfrak{a} + \mathfrak{n}$. In fact, if $iW = X + Y + Z$ with $X \in \mathfrak{t}$, $Y \in \mathfrak{a}$, and $Z \in \mathfrak{n}$, then $iW = (iW)^* = X^* + Y^* + Z^* = -X + Y + Z^*$. Hence $2iW = 2Y + Z + Z^*$. Since the matrix of $W$ has only zeros on the diagonal, we get $Y = 0$, whence $2iW = Z + Z^*$. Then $W = -(i/2)Z - (i/2)Z^*$, and this contradicts one of the above-mentioned properties of $W$. Thus $iW \notin \mathfrak{g} \setminus (\mathfrak{t} + \mathfrak{a} + \mathfrak{n})$, and this completes the proof. □

2. Iwasawa decompositions for involutive Banach-Lie groups

In this section we sketch an abstract framework that allows us to investigate Iwasawa decompositions for involutive infinite-dimensional Lie groups modeled on Banach spaces. We will apply these abstract statements in Sections 4, 5, and 6 in the case of the classical Banach-Lie groups associated with norm ideals. The central idea of this abstract approach is that the local Iwasawa decompositions can be constructed out of certain special elements of Lie algebras, which we call Iwasawa regular elements (Definition 2.6).

Preliminaries on local spectral theory. Throughout the paper we let $\mathbb{R}$, $\mathbb{C}$, and $\mathbb{H}$ stand for the fields of the real, complex, and quaternionic numbers, respectively.

For a real or complex Banach space $\mathfrak{X}$ we denote either by $\id_{\mathfrak{X}}$ or simply by $\mathfrak{I}$ the identity map of $\mathfrak{X}$, by $\mathfrak{X}^*$ the topological dual of $\mathfrak{X}$, by $\mathcal{B}(\mathfrak{X})$ the algebra of all bounded linear operators on $\mathfrak{X}$ and, when $\mathfrak{X}$ is a complex Banach space, we denote by $\sigma(D)$ the spectrum of $D$ whenever $D \in \mathcal{B}(\mathfrak{X})$. In this case, for every $x \in \mathfrak{X}$ we denote by $\sigma_D(x)$ the local spectrum of $x$ with respect to $D$. We recall that $\sigma_D(x)$ is a closed subset of $\sigma(D)$ and $w \in \mathbb{C} \setminus \sigma_D(x)$ if and only if there exists an open neighborhood $W$ of $w$ and a holomorphic function $\xi : W \to \mathfrak{X}$ such that $(z\id_{\mathfrak{X}} - D)\xi(z) = x$ for every $z \in W$. If $F \subseteq \mathbb{C}$ we denote

$$\mathfrak{X}_D(F) = \{x \in \mathfrak{X} \mid \sigma_D(x) \subseteq F\}.$$  

We note that, in the case when $\mathfrak{X}$ has finite dimension $m$, we have

$$\mathfrak{X}_D(F) = \bigoplus_{\lambda \in F \cap \sigma(D)} \ker((D - \lambda\id_{\mathfrak{X}})^m)$$

for every $F \subseteq \mathbb{C}$, while if $\mathfrak{X}$ is a Hilbert space and $D$ is a normal operator with the spectral measure $E_D(\cdot)$, then

$$\mathfrak{X}_D(F) = \operatorname{Ran} E_D(F)$$

whenever $F$ is a closed subset of $\mathbb{C}$.

See §12 in [BS01] for a review of the few facts needed from local spectral theory. (More bibliographical details can be found in the Notes to Chapter I in [BS01].)
Projections on kernels of skew-Hermitian operators.

Notation 2.1. The following notation will be used throughout the paper:

- For every complex Banach space $X$ we denote $\ell_\infty^c(X) := \{ f : \mathbb{R} \to X \mid \|f\|_\infty := \sup_{t \in \mathbb{R}} \|f(t)\| < \infty \}$, which is in turn a complex Banach space.
- We pick a state $\mu : \ell_\infty^c(\mathbb{R}) \to \mathbb{C}$ of the commutative unital $C^*$-algebra $\ell_\infty^c(\mathbb{R})$ satisfying the translation invariance condition
  \[ (\forall f \in \ell_\infty^c(\mathbb{R}) \ (\forall t \in \mathbb{R}) \quad \mu(f(\cdot)) = \mu(f(\cdot + t)) \]
  and the symmetry condition
  \[ (\forall f \in \ell_\infty^c(\mathbb{R}) \quad \mu(f(\cdot)) = \mu(f(-\cdot)). \]
  (See Problem 7 in Chapter 2 of [Pa88].) For every $f \in \ell_\infty^c(\mathbb{R})$ we denote $\mu(f(\cdot)) = \int \mu(f(t)) d\mu(t)$.
- For every complex Banach space $X$ and every $f \in \ell_\infty^c(X)$ we define $\mu(f) = \int f(t) d\mu(t) \in X^{**}$ by the formula
  \[ (\mu(f))(\varphi) = \int_{\mathbb{R}} \varphi(f(t)) d\mu(t) \]
  whenever $\varphi \in X^*$ (see [BP07]). □

Definition 2.2. Let $X_0$ be a real Banach space with the complexification $X = (X_0)^c = X_0 + iX_0$, which is a complex Banach space with the norm given by
  \[ \|y_1 + iy_2\| := \sup_{t \in [0,2\pi]} \|(\cos t)y_1 + (\sin t)y_2\| \text{ for all } y_1, y_2 \in X_0. \]
Let $A : X_0 \to X_0$ be a bounded linear operator such that $\sup_{t \in \mathbb{R}} \|\exp(tA)\| < \infty$, and denote also by $A : X \to X$ the $\mathbb{C}$-linear extension of $A : X_0 \to X_0$. In this case we define
  \[ X_A^+ := X_A(i[0,\infty)) = \left\{ y \in X \mid \limsup_{t \to \infty} \frac{1}{t} \log \|\exp(itA)y\| \leq 0 \right\} \]
(see also Remark 1.3 in [Be05]). Now assume that $X_0$ is a reflexive Banach space. Then $X$ will be a reflexive complex Banach space, and there exists a bounded linear operator $D_{X,A} : X \to X$ defined by
  \[ (\forall y \in X) \quad D_{X,A} y = \int_{\mathbb{R}} (\exp(tA))y d\mu(t). \]
It is easy to see that $D_{X,A}X_0 \subseteq X_0$, and we shall define $D_{X_0,A} := D_{X,A}|X_0 : X_0 \to X_0$. In addition, we define $X_{A}^{0,+} := X_A^+ \cap \text{Ker} D_{X,A}$. □

Remark 2.3. In the setting of Definition 2.2 we have
  \[ (D_{X,A})^2 = D_{X,A}, \quad \text{Ran} D_{X,A} = \text{Ker} A \subseteq X, \quad \text{and} \quad \text{Ran} D_{X_0,A} = (\text{Ker} A) \cap X_0 \]
(see [BP07]). □
Elliptic involutive Banach-Lie algebras and abstract Iwasawa decompositions.

**Definition 2.4.** Let $\mathfrak{g}_0$ be an involutive real or complex Banach-Lie algebra, that is, $\mathfrak{g}_0$ is equipped with a continuous linear mapping $X \mapsto X^*$ such that $(X^*)^* = X$ and $[X,Y]^* = -[X^*,Y^*]$ whenever $X,Y \in \mathfrak{g}_0$. If $\mathfrak{g}_0$ is a complex Banach-Lie algebra, then we assume in addition that $(iX)^* = -iX^*$ for all $X \in \mathfrak{g}_0$.

We say that $\mathfrak{g}_0$ is an **elliptic involutive Banach-Lie algebra** if $\|\exp(t \cdot \text{ad}_{\mathfrak{g}_0}X)\| \leq 1$ whenever $t \in \mathbb{R}$ and $X = -X^* \in \mathfrak{g}_0$.

**Remark 2.5.** In the special case of the canonically involutive real Banach-Lie algebras (that is, $X^* = -X$ for all $X \in \mathfrak{g}_0$) the above Definition 2.4 coincides with Definition IV.3 in 
(Nee02b) (or Definition 8.24 in [Be06]).

**Definition 2.6.** Let $\mathfrak{g}_0$ be an elliptic real Banach-Lie algebra with the complexification $\mathfrak{g}$, and denote $\mathfrak{p}_0 := \{X \in \mathfrak{g}_0 \mid X^* = X\}$. An **Iwasawa decomposition of** $\mathfrak{g}_0$ is a direct sum decomposition

$$\mathfrak{g}_0 = \mathfrak{t}_0 + \mathfrak{a}_0 + \mathfrak{n}_0 \tag{2.1}$$

satisfying the following conditions:

(j) We have $\mathfrak{t}_0 = \{X \in \mathfrak{g}_0 \mid X^* = -X\}$.

(ii) The term $\mathfrak{a}_0$ is a linear subspace of $\mathfrak{p}_0$ such that $[\mathfrak{a}_0,\mathfrak{a}_0] = \{0\}$.

(iii) There exists $X_0 \in \mathfrak{a}_0$ such that $\mathfrak{a}_0 = \mathfrak{a}_{X_0}$ and $\mathfrak{n}_0 = \mathfrak{n}_{X_0}$, where

$$\mathfrak{a}_{X_0} = \mathfrak{p}_0 \cap \ker (\text{ad}(X_0)) \quad \text{and} \quad \mathfrak{n}_{X_0} = \mathfrak{g}_0 \cap \mathfrak{g}^{0,+}_{\text{ad}(-iX_0)}.$$

In this case we say that $X_0$ is an **Iwasawa regular element of** $\mathfrak{g}_0$ and $\mathfrak{g}^{0,+}$ is the **Iwasawa decomposition of** $\mathfrak{g}_0$ associated with $X_0$. In the case when the conditions (2.1), (j), and (iii) are satisfied, we say that $X_0$ is an **Iwasawa quasi-regular element** (and (2.1) is still called the Iwasawa decomposition of $\mathfrak{g}_0$ associated with $X_0$).

Now let us assume that $G$ is a connected Banach-Lie group with $\mathbb{L}(G) = \mathfrak{g}_0$ and $K$, $A$, and $N$ are the connected Banach-Lie groups which are subgroups of $G$ and correspond to the Lie algebras $\mathfrak{k}_0$, $\mathfrak{a}_0$, and $\mathfrak{n}_0$, respectively. If the mapping

$$m: K \times A \times N \rightarrow G, \quad (k,a,n) \mapsto k a n \tag{2.2}$$

is a diffeomorphism, then we say that this mapping is the **global Iwasawa decomposition of** $G$ corresponding to (2.1).

**Remark 2.7.** In the setting of Definition 2.6 if $X_0$ is an Iwasawa regular element, then it is easy to see that $\mathfrak{a}_{X_0}$ is a maximal linear subspace of $\mathfrak{p}_0$ such that $[\mathfrak{a}_{X_0},\mathfrak{a}_{X_0}] = \{0\}$, while $\mathfrak{n}_{X_0}$ is a closed subalgebra of $\mathfrak{g}_0$ (see also [Be05]).

**Remark 2.8.** In the setting of Definition 2.6 it is easy to see that all of the groups $K$, $A$, and $N$ are Banach-Lie subgroups of $G$. (See [Up85] or [Be06] for details on the latter notion.)

**Proposition 2.9.** In the setting of Definition 2.6 let us assume that the Banach-Lie algebra $\mathfrak{g}_0$ is actually an elliptic involutive complex Banach-Lie algebra. Then
for every $X \in \mathfrak{p}_0$ and every closed subset $F$ of $\mathbb{R}$ we have

$$\mathfrak{g}_0 \cap \mathfrak{g}_{\text{ad}X}(F) = (\mathfrak{g}_0)_{\text{ad}X}(F).$$

**Proof.** By the hypothesis that $\mathfrak{g}_0$ is an elliptic Banach-Lie algebra, it follows that $\text{ad}_{\mathfrak{g}_0}X : \mathfrak{g}_0 \to \mathfrak{g}_0$ is a Hermitian operator (see Definition 5.23 in [Be06]). If $\mathfrak{g}$ stands for the complexification of $\mathfrak{g}_0$, then $\text{ad}_{\mathfrak{g}}X : \mathfrak{g} \to \mathfrak{g}$ is Hermitian as well. In particular, there exist quasimultiplicative maps $\Psi_{\text{ad}_{\mathfrak{g}_0}X} : C^\infty(\mathbb{R}) \to \mathcal{B}(\mathfrak{g}_0)$ and $\Psi_{\text{ad}_{\mathfrak{g}}X} : C^\infty(\mathbb{R}) \to \mathcal{B}(\mathfrak{g})$ such that $\Psi_{\text{ad}_{\mathfrak{g}_0}X}(\text{id}_2) = \text{ad}_{\mathfrak{g}_0}X$ and $\Psi_{\text{ad}_{\mathfrak{g}}X}(\text{id}_2) = \text{ad}_{\mathfrak{g}}X$, respectively. The maps $\Psi_{\text{ad}_{\mathfrak{g}_0}X}$ and $\Psi_{\text{ad}_{\mathfrak{g}}X}$ can be constructed by the Weyl functional calculus as in Example 5.25 in [Be06].

Now let $\iota : \mathfrak{g}_0 \hookrightarrow \mathfrak{g}$ be the inclusion map. Then $\iota(X) = X$, so Remark 5.19 in [Be06] shows that for every closed subset $F \subseteq \mathbb{R}$ we have $\iota((\mathfrak{g}_0)_{\text{ad}_{\mathfrak{g}_0}X}(F)) \subseteq \mathfrak{g}_{\text{ad}X}(F)$, whence $(\mathfrak{g}_0)_{\text{ad}X}(F) \subseteq \mathfrak{g}_0 \cap \mathfrak{g}_{\text{ad}X}(F)$.

To prove the converse inclusion, denote by $\kappa : \mathfrak{g} \to \mathfrak{g}$ the conjugation on $\mathfrak{g}$ whose fixed point set is $\mathfrak{g}_0$, and then define $\pi : \mathfrak{g} \to \mathfrak{g}_0$, $\pi(Z) = (Z + \kappa(Z))/2$. Then $\pi(X) = X$, whence $\pi \circ (\text{ad}_{\mathfrak{g}_0}X) = (\text{ad}_{\mathfrak{g}_0}X) \circ \pi$. Now Remark 5.19 in [Be06] again shows that for every closed subset $F$ of $\mathbb{R}$ we have $\pi(\mathfrak{g}_{\text{ad}X}(F)) \subseteq \mathfrak{g}_{\text{ad}X}(F)$, whence $\mathfrak{g}_0 \cap \mathfrak{g}_{\text{ad}X}(F) \subseteq \mathfrak{g}_{\text{ad}X}(F)$, and we are done. \hfill $\square$

**Remark 2.10.** In the special case when $\dim \mathfrak{g}_0 < \infty$ and $F$ is a certain finite subset of $\mathbb{R}_+$, the conclusion of our Proposition 2.9 was obtained in Chapter VI, §6 of [Ho01] by using the structure theory of finite-dimensional complex semisimple Lie algebras. \hfill $\square$

**Proposition 2.11.** Let $\tilde{\mathfrak{g}}$ be an elliptic complex Banach-Lie algebra whose underlying Banach space is reflexive, and pick $X_0 = X^*_0 \in \tilde{\mathfrak{g}}$. Assume that we have a bounded linear operator $\tilde{T} : \tilde{\mathfrak{g}} \to \tilde{\mathfrak{g}}$ such that

$$\tilde{T}^2 = \tilde{T},$$

$$\text{Ran} \tilde{T} = \tilde{\mathfrak{g}}_{\text{ad}X_0}(\mathbb{R}_+),$$

$$\text{Ran}(1 - \tilde{T}) \subseteq \tilde{\mathfrak{g}}_{\text{ad}X_0}(-\mathbb{R}_+).$$

Then $X_0$ is an Iwasawa quasi-regular element of $\tilde{\mathfrak{g}}$. Now let

$$\tilde{\mathfrak{g}} = \tilde{\mathfrak{x}} + \tilde{\mathfrak{a}} + \tilde{\mathfrak{n}}$$

be the Iwasawa decomposition of $\tilde{\mathfrak{g}}$ associated with $X_0$, and for $\tilde{s} \in \{\tilde{\mathfrak{x}}, \tilde{\mathfrak{a}}, \tilde{\mathfrak{n}}\}$, denote by $p_\tilde{s} : \tilde{\mathfrak{g}} \to \tilde{s}$ the linear projections corresponding to the direct sum decomposition (2.5). Then for all $X \in \tilde{\mathfrak{g}}$ we have

$$p_{\tilde{\mathfrak{x}}}(X) = (1 - \tilde{T})X - ((1 - \tilde{T})X)^* + \frac{1}{2}(D_{\tilde{\mathfrak{g}},\text{ad}(-iX_0)}X - (D_{\tilde{\mathfrak{g}},\text{ad}(-iX_0)}X)^*),$$

$$p_{\tilde{\mathfrak{a}}}(X) = \frac{1}{2}(D_{\tilde{\mathfrak{g}},\text{ad}(-iX_0)}X + (D_{\tilde{\mathfrak{g}},\text{ad}(-iX_0)}X)^*),$$

$$p_{\tilde{\mathfrak{n}}}(X) = (\tilde{T} - D_{\tilde{\mathfrak{g}},\text{ad}(-iX_0)})X + ((1 - \tilde{T})X)^*.$$

**Proof.** To begin with, recall that

$$\tilde{\mathfrak{x}} = \{X \in \tilde{\mathfrak{g}} \mid X^* = -X\},$$

$$\tilde{\mathfrak{a}} = \{X \in \tilde{\mathfrak{g}} \mid X^* = X \text{ and } [X_0, X] = 0\}, \text{ and}$$

$$\tilde{\mathfrak{n}} = \tilde{\mathfrak{g}}_{\text{ad}(-iX_0)}^{0,+} = \tilde{\mathfrak{g}}_{\text{ad}X_0}(\mathbb{R}_+) \cap \text{Ker} D_{\tilde{\mathfrak{g}},\text{ad}(-iX_0)};$$
where the latter two equalities follow by Proposition 2.3, Definition 2.2, and Definition 2.6. It is straightforward to check that \( \tilde{t} \cap (\tilde{a} + \tilde{n}) = \tilde{a} \cap \tilde{n} = \{0\} \), whence
\[
\tilde{t} \cap (\tilde{a} + \tilde{n}) = \tilde{a} \cap (\tilde{t} + \tilde{n}) = \tilde{n} \cap (\tilde{t} + \tilde{a}) = \{0\},
\]
and it remains to prove that \( \tilde{t} + \tilde{a} + \tilde{n} = \tilde{g} \).

For this purpose, first note that \( D_{\tilde{g}, \text{ad}(-iX_0)} \) and \( T \) are idempotent operators on \( \tilde{g} \) satisfying
\[
\text{Ran} \, D_{\tilde{g}, \text{ad}(-iX_0)} \subseteq \text{Ran} \, T;
\]
hence
\[
(2.9) \quad \tilde{T} D_{\tilde{g}, \text{ad}(-iX_0)} = D_{\tilde{g}, \text{ad}(-iX_0)} \tilde{T} = D_{\tilde{g}, \text{ad}(-iX_0)}.
\]
Now let \( X \in \tilde{g} \) be arbitrary and denote by \( X_t, X_n, \) and \( X_0 \) the right-hand sides of the wished-for formulas for \( p_t(X), p_n(X), \) and \( p_n(X) \), respectively. Thus we have to prove that \( p_0(X) = X_0 \) for any \( s \in \{t, a, n\} \). Moreover, it is clear that \( X = X_t + X_n + X_0 \), so it will be enough to check that \( X_t \in \tilde{t}, X_n \in \tilde{a}, \) and \( X_0 \in \tilde{n} \).

It follows at once by (2.6) that \( X_t \in \tilde{t} \). To see that \( X_0 \in \tilde{a} \), first note that \( X_0^* = X_a \). On the other hand, we have \( [X_0, D_{\tilde{g}, \text{ad}(-iX_0)}] = 0 \) (see Remark 2.3). Since \( X_0 = X_0^* \), it then follows that \( [X_0, (D_{\tilde{g}, \text{ad}(-iX_0)})^*] = 0 \), whence \( [X_0, X_a] = 0 \). Thus \( X_a \in \tilde{a} \).

It remains to show that \( X_n \in \tilde{n} \). To this end, first note that
\[
D_{\tilde{g}, \text{ad}(-iX_0)}(\tilde{T} - D_{\tilde{g}, \text{ad}(-iX_0)})X = 0
\]
and
\[
D_{\tilde{g}, \text{ad}(-iX_0)}((1 - \tilde{T})X)^* = (D_{\tilde{g}, \text{ad}(-iX_0)}(1 - \tilde{T})X)^* = 0
\]
by (2.9) and the fact that \( (D_{\tilde{g}, \text{ad}(-iX_0)}Y)^2 = D_{\tilde{g}, \text{ad}(-iX_0)}Y \). (We also used the fact that \( D_{\tilde{g}, \text{ad}(-iX_0)}(Y^*) = (D_{\tilde{g}, \text{ad}(-iX_0)}Y)^* \) whenever \( Y \in \tilde{g} \), which is a consequence of Definition 2.2 since \( X_0^* = X_0 \).) It then follows that \( D_{\tilde{g}, \text{ad}(-iX_0)}(X_n) = 0 \). Thus, according to (2.8), we still have to prove that \( X_n \in \text{ad}(-iX_0)(\tilde{g}_+). \) For this purpose we are going to show that both terms in the expression of \( X_n \) belong to \( \text{ad}(-iX_0)(\tilde{g}_+) \).

In fact, by (2.9) and (2.3) we get
\[
(\tilde{T} - D_{\tilde{g}, \text{ad}(-iX_0)})X = \tilde{T}(1 - D_{\tilde{g}, \text{ad}(-iX_0)})X \subseteq \text{Ran} \, \tilde{T} \subseteq \tilde{g}_+ = \tilde{g}_+(\tilde{g}_+).
\]

On the other hand, the mapping \( \kappa: \tilde{g} \to \tilde{g}, Y \mapsto Y^* \) has the property
\[
\theta \circ \text{ad} X_0 = -\text{ad} X_0 \circ \theta
\]
since \( X_0^* = X_0 \). Then Proposition 5.22 in [Be06] shows that
\[
\kappa(\text{ad} X_0(-\tilde{g}_+)) \subseteq \tilde{g}_+(\tilde{g}_+),
\]
whence by (2.4) we get \((1 - \tilde{T})X = \kappa((1 - \tilde{T})X)X \in \tilde{g}_+(\tilde{g}_+). \)

Consequently
\[
X_n = (\tilde{T} - D_{\tilde{g}, \text{ad}(-iX_0)}X + ((1 - \tilde{T})X)^* \in \tilde{g}_+(\tilde{g}_+),
\]
and the proof is complete.

**Corollary 2.12.** Assume the setting of Proposition 2.11 and let \( g \) be a closed involutive complex subalgebra of \( \tilde{g} \) such that
\[
X_0 \in g \quad \text{and} \quad \tilde{T}(g) \subseteq g.
\]
Then \( X_0 \) is an Iwasawa quasi-regular element of \( g \) and the Iwasawa decomposition of \( g \) associated with \( X_0 \) is \( g = (\tilde{t} \cap g) + (\tilde{a} \cap g) + (\tilde{n} \cap g) \).
Proof. Since \( \bar{T}(g) \subseteq g \) and \( D_{g,\text{ad}(-iX_0)}(g) \subseteq g \), it follows by Proposition 2.11 that \( p_\delta(g) \subseteq g \), \( p_\alpha(g) \subseteq g \), and \( p_\gamma(g) \subseteq g \). It then follows by the direct sum decomposition (2.5) that \( g = (\bar{\mathfrak{t}} \cap g) + (\bar{\mathfrak{a}} \cap g) + (\bar{\mathfrak{n}} \cap g) \). Thus, to conclude the proof, it remains to prove that
\[
\bar{\mathfrak{a}} \cap g = \{ X \in g \mid X^* = X \} \quad \text{and} \quad \bar{\mathfrak{n}} \cap g = g^{0,+}_{\text{ad}(-iX_0)} \quad \text{(see also Proposition 2.9)}
\]
The equality involving \( \bar{\mathfrak{a}} \cap g \) is obvious. To prove the equality involving \( \bar{\mathfrak{n}} \cap g \), just note that by Proposition 2.9 we have
\[
\bar{\mathfrak{n}} \cap g = g^{0,+}_{\text{ad}(-iX_0)} \cap g = g_{\text{ad}(-iX_0)}(\mathbb{R}_+) \cap (\ker D_{g,\text{ad}(-iX_0)} \cap g)
\]
\[
= g_{\text{ad}(-iX_0)}(\mathbb{R}_+) \cap (\ker D_{g,\text{ad}(-iX_0)}) = g^{0,+}_{\text{ad}(-iX_0)}
\]
and this completes the proof. \( \square \)

Corollary 2.13. Assume the setting of Proposition 2.11 and let \( g_0 \) be a closed involutive real subalgebra of \( \bar{g} \) such that
\[
X_0 \subseteq g_0, \quad \bar{T}(g_0) \subseteq g_0, \quad \text{and} \quad g_0 \cap ig_0 = \{0\}.
\]
Then \( X_0 \) is an Iwasawa quasi-regular element of \( g \) and the Iwasawa decomposition of \( g \) associated with \( X_0 \) is \( \bar{g}_0 = (\bar{\mathfrak{t}} \cap g_0) + (\bar{\mathfrak{a}} \cap g_0) + (\bar{\mathfrak{n}} \cap g_0) \).

Proof. Denote \( g := g_0 + ig_0 \subseteq \bar{g} \). Since \( g_0 \cap ig_0 = \{0\} \), it follows that \( g \) is isomorphic to the complexification of \( g_0 \) (as a complex involutive Banach-Lie algebra).

We have \( X_0 \subseteq g_0 \subseteq g \) and \( \bar{T}(g) = \bar{T}(g_0 + ig_0) \subseteq g_0 + ig_0 = g \); hence Corollary 2.12 shows that \( X_0 \) is Iwasawa regular in \( g \) and the corresponding Iwasawa decomposition of \( g \) is \( g = (\bar{\mathfrak{t}} \cap g) + (\bar{\mathfrak{a}} \cap g) + (\bar{\mathfrak{n}} \cap g) \).

In particular we get \( g^{0,+}_{\text{ad}(-iX_0)} = \bar{\mathfrak{n}} \cap g \), whence
\[
g_0 \cap g^{0,+}_{\text{ad}(-iX_0)} = \bar{\mathfrak{n}} \cap g_0.
\]

On the other hand, it is obvious that
\[
\{ X \in g_0 \mid X^* = -X \} = \bar{\bar{\mathfrak{t}}} \cap g_0 \quad \text{and} \quad \{ X \in g_0 \mid X^* = X \} \cap \{ X_0, X = 0 \} = \bar{\mathfrak{a}} \cap g_0;
\]
hence the conclusion will follow by \( g_0 = (\bar{\bar{\mathfrak{t}}} \cap g_0) + (\bar{\mathfrak{a}} \cap g_0) + (\bar{\mathfrak{n}} \cap g_0) \), and this direct sum decomposition can be obtained just as in the proof of Corollary 2.12. Indeed, we have \( \bar{T}(g_0) \subseteq g_0 \) and \( D_{g,\text{ad}(-iX_0)}(g_0) \subseteq g_0 \). Then we can use Proposition 2.11 to show that \( p_\delta(g_0) \subseteq g_0 \), \( p_\alpha(g_0) \subseteq g_0 \), and \( p_\gamma(g_0) \subseteq g_0 \). Since \( \bar{g} = \bar{\mathfrak{t}} + \bar{\mathfrak{a}} + \bar{\mathfrak{n}} \) by the hypothesis, it then follows that \( g_0 = (\bar{\mathfrak{t}} \cap g_0) + (\bar{\mathfrak{a}} \cap g_0) + (\bar{\mathfrak{n}} \cap g_0) \). \( \square \)

Inductive limits of Iwasawa decompositions.

Lemma 2.14. Let \( \Psi: \tilde{S}_1 \to \tilde{S}_2 \) be an open bijective mapping between two topological spaces. Assume that \( S_j \) is a closed subset of \( \tilde{S}_j \) for \( j = 1, 2 \) such that \( \Psi(S_1) \) is a dense subset of \( S_2 \). Then \( \Psi(S_1) = S_2 \).

Proof. We have to prove that \( S_2 \subseteq \Psi(S_1) \). The hypothesis that \( \Psi: \tilde{S}_1 \to \tilde{S}_2 \) is an open bijection implies that its inverse \( \Psi^{-1}: \tilde{S}_2 \to \tilde{S}_1 \) is continuous. Then by using the other hypothesis, namely \( \Psi(S_1) = S_2 \), we get
\[
\Psi^{-1}(S_2) = \Psi^{-1}(\Psi(S_1)) \subseteq \Psi^{-1}(S_1) = S_1
\]
which concludes the proof since \( \Psi \) is a bijection. \( \square \)
Proposition 2.15. Let \( \widetilde{G} \) be a Banach-Lie group and assume that \( \widetilde{K}, \widetilde{A}, \) and \( \widetilde{N} \) are Banach-Lie subgroups of \( \widetilde{G} \) such that the multiplication map \( \tilde{m} : \widetilde{K} \times \widetilde{A} \times \widetilde{N} \to \widetilde{G}, \) \((\widetilde{k}, \widetilde{a}, \widetilde{n}) \mapsto \widetilde{kan} \) is a diffeomorphism.

Then let \( G, K, A, \) and \( N \) be four connected Lie subgroups of \( \widetilde{G} \) with \( L(G) = \mathfrak{g}, L(K) = \mathfrak{t}, L(A) = \mathfrak{a}, \) and \( L(N) = \mathfrak{n} \), and assume that \( \mathfrak{g} \) is an elliptic real Banach-Lie algebra and \( X_0 \in \mathfrak{g} \) is an Iwasawa regular element such that the following conditions are satisfied:

\[(j)\] We have \( K \subseteq \widetilde{K} \cap G, A \subseteq \widetilde{A} \cap G, N \subseteq \widetilde{N} \cap G, \) and \( G \) is a Banach-Lie subgroup of \( \widetilde{G} \).

\[(jj)\] The Iwasawa decomposition of \( \mathfrak{g} \) with respect to \( X_0 \) is \( \mathfrak{g} = \mathfrak{t} + \mathfrak{a} + \mathfrak{n} \).

\[(iii)\] There exists a family \( \{\mathfrak{g}_i\}_{i \in I} \) consisting of finite-dimensional reductive subalgebras of \( \mathfrak{g} \) such that

- there exists a bounded linear map \( \mathcal{E}_i : \mathfrak{g} \to \mathfrak{g} \) such that \( \mathcal{E}_i(X^*) = \mathcal{E}_i(X)^* \) for all \( X \in \mathfrak{g} \),
- \( (\mathcal{E}_i)^2 = \mathcal{E}_i \), \( \text{Ran} \mathcal{E}_i = \mathfrak{g}_i \), and \( \{\text{Ran} (1 - \mathcal{E}_i), \mathfrak{g}_i\} = \{0\} \),
- \( \mathcal{E}_i(X_0) \) is an Iwasawa regular element of \( \mathfrak{g}_i \), and
- the connected subgroup \( G_i \) of \( G \) with \( L(G_i) = \mathfrak{g}_i \) is a closed subgroup and a finite-dimensional reductive Lie group for every \( i \in I \), and \( \bigcup_{i \in I} \mathfrak{g}_i = \mathfrak{g} \).

Then the mapping \( m := \tilde{m}|_{K \times A \times N} : K \times A \times N \to G \) is a diffeomorphism. Moreover, \( AN = NA \) and both groups \( A \) and \( N \) are simply connected.

Proof. Since \( \tilde{m} \) is smooth and \( G \) is a Banach-Lie subgroup of \( \widetilde{G} \) by hypothesis \((j)\), it follows that \( m \) is a smooth mapping. Then condition \((jj)\) shows that the tangent map of \( m \) at any point of \( K \times A \times N \) is an invertible continuous linear operator; hence \( m \) is a local diffeomorphism. On the other hand, \( m \) is injective since \( \tilde{m} \) is so.

It remains to prove that \( m \) is surjective. To this end let \( i \in I \) and denote by \( T_i = \mathfrak{t}_i + \mathfrak{a}_i + \mathfrak{n}_i \) the Iwasawa decomposition of \( \mathfrak{g}_i \) with respect to \( \mathcal{E}_i(X_0) \). Also let \( G_i = K_i A_i N_i \) be the corresponding global Iwasawa decomposition of the finite-dimensional reductive Lie group \( G_i \) (see [Kn96]). We have

\[ T_i = \{ X \in \mathfrak{g}_i \mid X^* = -X \} = \mathfrak{t} \cap \mathfrak{g}_i. \]

Also

\[ a_i = \{ X = X^* \in \mathfrak{g}_i \mid [X, \mathcal{E}_i(X_0)] = 0 \} \subseteq \{ X = X^* \in \mathfrak{g}_i \mid [X, X_0] = 0 \} = \mathfrak{a} \cap \mathfrak{g}_i, \]

since \( [\mathfrak{g}_i, \text{Ran} (1 - \mathcal{E}_i)] = \{0\} \). Finally, by Definitions 2.22 and 2.60 we get

\[ n_i = \mathfrak{g}_i \cap ((\mathfrak{g}_i)_C)^{0, +}_{\text{adm}(-1X_0)} \subseteq \mathfrak{g}_i \cap (\mathfrak{g}_i)_C^{0, +}_{\text{adm}(-1X_0)} \cap \mathfrak{g}_i = \mathfrak{n} \cap \mathfrak{g}_i, \]

where \( (\bullet)_C \) stands for the complexification of a Lie algebra. Consequently we have \( K_i \subseteq K \cap G_i, A_i \subseteq A \cap G_i, \) and \( N_i \subseteq N \cap G_i. \) (Here we use the fact that each of the groups \( K_i, A_i, \) and \( N_i \) is connected since \( G_i \) is connected and there exists a diffeomorphism \( G_i \approx K_i \times A_i \times N_i. \))

Now we are going to apply Lemma 2.14 for the spaces \( \tilde{S}_1 = \tilde{K} \times \tilde{A} \times \tilde{N}, \tilde{S}_2 = \tilde{G}, \)
\( \tilde{S}_1 = K \times A \times N, \) and \( \tilde{S}_2 = G. \) The mapping \( \tilde{m} \) is an open bijection since it is a diffeomorphism. On the other hand,

\[ m(K \times A \times N) \supseteq \bigcup_{i \in I} m(K_i \times A_i \times N_i) = \bigcup_{i \in I} G_i; \]
We shall say that \( GL \) hence \( m(K \times A \times N) \) is a dense subset of \( G \). (Note that \( \bigcup_{i \in I} G_i \) is dense in \( G \) since \( \bigcup_{i \in I} g_i \) is dense in \( g \) and \( G \) is connected.) Thus Lemma 2.14 applies and shows that \( m(K \times A \times N) = G \), hence \( m : K \times A \times N \rightarrow G \) is a diffeomorphism.

To complete the proof, use the inverse diffeomorphism \( m^{-1} : G \rightarrow K \times A \times N \). Since \( \bigcup_{i \in I} G_i \) is dense in \( G \), it follows that \( \bigcup_{i \in I} K_i \) is dense in \( K \), \( \bigcup_{i \in I} A_i \) is dense in \( A \), and \( \bigcup_{i \in I} N_i \) is dense in \( N \). Now the conclusion follows since \( A_i N_i = N_i A_i \) and both groups \( A_i \) and \( N_i \) are simply connected for all \( i \in I \).

3. CLASSICAL BANACH-LIE GROUPS AND THEIR LIE ALGEBRAS

In this section we introduce the Banach-Lie groups and Lie algebras whose Iwasawa decompositions will be investigated in Sections 4, 5, and 6 and we record a few auxiliary results that will be used in those sections.

**Definition 3.1.** We denote by \( GL(H) \) the group of all invertible bounded linear operators on the complex Hilbert space \( H \) and by \( J \) an arbitrary norm ideal of \( B(H) \). We define the following complex Banach-Lie groups and Banach-Lie algebras:

1. \( GL^J(H) = GL(H) \cap (1 + J) \) \( \) with the Lie algebra
   \[
   L/GL^J(H) := gl^J(H) := J;
   \]
2. \( O^J(H) := \{ g \in GL^J(H) \mid g^{-1} = Jg^*J^{-1} \} \) \( \) with the Lie algebra
   \[
   L/O^J(H) := o^J(H) := \{ x \in J \mid x = -JxJ^{-1} \},
   \]
   where \( J : H \rightarrow H \) is a conjugation (i.e., \( J \) is a conjugate-linear isometry satisfying \( J^2 = 1 \));
3. \( Sp^J(H) := \{ g \in GL^J(H) \mid g^{-1} = \bar{J}g^*\bar{J}^{-1} \} \) \( \) with the Lie algebra
   \[
   L/Sp^J(H) := sp^J(H) := \{ x \in J \mid x = -\bar{J}x\bar{J}^{-1} \},
   \]
   where \( \bar{J} : H \rightarrow H \) is an anti-conjugation (i.e., \( \bar{J} \) a conjugate-linear isometry satisfying \( \bar{J}^2 = -1 \)).

We shall say that \( GL^J(H) \), \( O^J(H) \), and \( Sp^J(H) \) are the classical complex Banach-Lie groups associated with the operator ideal \( J \). Similarly, the corresponding Lie algebras are called the classical complex Banach-Lie algebras (associated with \( J \)).

When no confusion can occur, we shall denote the groups \( GL^J(H) \), \( O^J(H) \), and \( Sp^J(H) \) simply by \( GL \), \( O \), and \( Sp \), respectively, and we shall proceed similarly for the classical complex Lie algebras.

**Definition 3.2.** We shall use the notation of Definition 3.1 and define the following real Banach-Lie groups and Banach-Lie algebras:

1. \( GL^J(H; \mathbb{R}) = \{ g \in GL^J(H) \mid gJ = Jg \} \) \( \) with the Lie algebra
   \[
   L/GL^J(H; \mathbb{R}) := gl^J(H; \mathbb{R}) := \{ x \in J \mid xJ = Jx \},
   \]
   where \( J : H \rightarrow H \) is any conjugation on \( H \);
2. \( GL^J(H; \mathbb{H}) = \{ g \in GL^J(H) \mid g\bar{J} = \bar{J}g \} \) \( \) with the Lie algebra
   \[
   L/GL^J(H; \mathbb{H}) := gl^J(H; \mathbb{H}) := \{ x \in J \mid x\bar{J} = \bar{J}x \},
   \]
   where \( \bar{J} : H \rightarrow H \) is any anti-conjugation on \( H \);
(AIII) \( U_3(\mathcal{H}, \mathcal{H}_-) \) := \( \{ g \in \text{GL}_3(\mathcal{H}) \mid g^*Vg = V \} \) with the Lie algebra
\[
L(U_3(\mathcal{H}, \mathcal{H}_-)) := u_3(\mathcal{H}, \mathcal{H}_-) := \{ x \in \mathfrak{j} \mid x^*V = -Vx \},
\]
where \( \mathcal{H} = \mathcal{H}_+ \oplus \mathcal{H}_- \) and \( V = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \) with respect to this orthogonal direct sum decomposition of \( \mathcal{H} \):

(BI) \( O_2(\mathcal{H}_+, \mathcal{H}_-) \) := \( \{ g \in \text{GL}_2(\mathcal{H}) \mid g^{-1} = Jg^*J^{-1} \text{ and } g^*Vg = V \} \) with the Lie algebra
\[
L(O_2(\mathcal{H}_+, \mathcal{H}_-)) := o_2(\mathcal{H}_+, \mathcal{H}_-) := \{ x \in \mathfrak{j} \mid x = -Jx^*J^{-1} \text{ and } x^*V = -Vx \},
\]
where \( \mathcal{H} = \mathcal{H}_+ \oplus \mathcal{H}_- \), \( V = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \) with respect to this orthogonal direct sum decomposition of \( \mathcal{H} \), and \( J: \mathcal{H} \rightarrow \mathcal{H} \) is a conjugation on \( \mathcal{H} \) such that \( J(\mathcal{H}_+) \subseteq \mathcal{H}_- \);

(BII) \( O^+_3(\mathcal{H}) \) := \( \{ g \in \text{GL}_3(\mathcal{H}) \mid g^{-1} = Jg^*J^{-1} \text{ and } g\tilde{J} = \tilde{J}g \} \) with the Lie algebra
\[
L(O^+_3(\mathcal{H})) := o^+_3(\mathcal{H}) := \{ x \in \mathfrak{j} \mid x = -Jx^*J^{-1} \text{ and } x\tilde{J} = \tilde{J}x \},
\]
where \( J: \mathcal{H} \rightarrow \mathcal{H} \) is a conjugation and \( \tilde{J}: \mathcal{H} \rightarrow \mathcal{H} \) is an anti-conjugation such that \( J\tilde{J} = \tilde{J}J \);

(CI) \( \text{Sp}_3(\mathcal{H}; \mathbb{R}) \) := \( \{ g \in \text{GL}_3(\mathcal{H}) \mid g^{-1} = \tilde{J}g^*\tilde{J}^{-1} \text{ and } gJ = Jg \} \) with the Lie algebra
\[
\mathfrak{sp}_3(\mathcal{H}; \mathbb{R}) := \{ x \in \mathfrak{j} \mid -x = \tilde{J}x^*\tilde{J}^{-1} \text{ and } xJ = Jx \},
\]
where \( \tilde{J}: \mathcal{H} \rightarrow \mathcal{H} \) is any anti-conjugation and \( J: \mathcal{H} \rightarrow \mathcal{H} \) is any conjugation such that \( J\tilde{J} = \tilde{J}J \);

(CII) \( \text{Sp}_3(\mathcal{H}_+, \mathcal{H}_-) \) := \( \{ g \in \text{GL}_3(\mathcal{H}) \mid g^{-1} = \tilde{J}g^*\tilde{J}^{-1} \text{ and } g^*Vg = V \} \) with the Lie algebra
\[
L(\text{Sp}_3(\mathcal{H}_+, \mathcal{H}_-)) := \mathfrak{sp}_3(\mathcal{H}_+, \mathcal{H}_-) := \{ x \in \mathfrak{j} \mid x = -\tilde{J}x^*\tilde{J}^{-1} \text{ and } x^*V = -Vx \},
\]
where \( \mathcal{H} = \mathcal{H}_+ \oplus \mathcal{H}_- \), \( V = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \) with respect to this orthogonal direct sum decomposition of \( \mathcal{H} \), and \( J: \mathcal{H} \rightarrow \mathcal{H} \) is an anti-conjugation on \( \mathcal{H} \) such that \( J(\mathcal{H}_+) \subseteq \mathcal{H}_- \).

We say that \( \text{GL}_3(\mathcal{H}; \mathbb{R}) \), \( \text{GL}_3(\mathcal{H}; \mathbb{C}) \), \( U_3(\mathcal{H}, \mathcal{H}_-) \), \( O_3(\mathcal{H}_+, \mathcal{H}_-) \), \( O^+_3(\mathcal{H}) \), \( \text{Sp}_3(\mathcal{H}; \mathbb{R}) \), and \( \text{Sp}_3(\mathcal{H}_+, \mathcal{H}_-) \) are the classical real Banach-Lie groups associated with the operator ideal \( \mathfrak{j} \). Similarly, the corresponding Lie algebras are called the classical real Banach-Lie algebras (associated with \( \mathfrak{j} \)).

Remark 3.3. The classical Banach-Lie groups and algebras of Definitions 3.1 and 3.2 associated with the Schatten operator ideals \( \mathfrak{S}_p(\mathcal{H}) \) \( (1 \leq p \leq \infty) \) were introduced in [Ha72], where it was conjectured that the connected \( 1 \)-components of these groups have global Iwasawa decompositions in a natural sense (see subsection 8.4 in Section II.8 of [Ha72]).

We also note that as a by-product of the classification of the \( L^* \)-algebras (see for instance Theorems 7.18 and 7.19 in [Be06]), every (real or complex) topologically simple \( L^* \)-algebra is isomorphic to one of the classical Banach-Lie algebras associated with the Hilbert-Schmidt ideal \( \mathfrak{j} = \mathfrak{S}_2(\mathcal{H}) \).

Problem 3.4. In the setting of Definitions 3.1 and 3.2 the condition that \( \mathfrak{j} \) should be a norm ideal is necessary in order to make the corresponding groups into smooth manifolds modeled on Banach spaces (see for instance Proposition 9.28 in [Be06] or the beginning of the proof of Proposition 3.9 below). On the other hand, the
classical “Lie” groups and Lie algebras can be defined with respect to any operator ideal, irrespective of whether it is endowed with a complete norm or not, and there exist many interesting operator ideals which do not support complete norms at all; see \cite{KW02} and \cite{KW06}.

Thus it might prove important to study the Lie-theoretic aspects of the classical groups and Lie algebras associated with arbitrary operator ideals, and perhaps to establish a bridge between the Lie theory and the commutator structure of operator ideals described in the papers \cite{DFWW} and \cite{We05}.

We shall need the following generalization of Proposition 3 in \cite{Ba69}.

**Lemma 3.5.** Let $\mathcal{H}$ be a complex separable infinite-dimensional Hilbert space, $\tilde{J}: \mathcal{H} \to \mathcal{H}$ an anti-conjugation, and $K \in \{\mathbb{R}, \mathbb{C}\}$. Also let $Z: \mathcal{H} \to \mathcal{H}$ be a $K$-linear continuous operator such that $Z\tilde{J} = \tilde{J}Z$ and $Z^2 = z_01$ for some $z_0 \in (0, \infty)$.

Then there exists an orthonormal basis $\{\xi^{(e)}_l\}_{l \in \mathbb{Z} \setminus \{0\}}$ in the Hilbert space $\mathcal{H}$ over $K$ such that $Z\xi^{(e)}_l = \varepsilon\xi^{(e)}_l$ and $\tilde{J}\xi^{(e)}_l = \mp\xi^{(e)}_{-l}$ whenever $\varepsilon \in \{\pm \sqrt{z_0}\}$ and $l = 1, 2, \ldots$.

**Proof.** Denote $\mathcal{H}^{(e)} = \text{Ker}(Z - \varepsilon)$ for $\varepsilon \in \{\pm \sqrt{z_0}\}$. Since $Z^2 = z_01$, it follows that $\mathcal{H} = \mathcal{H}^{(\sqrt{z_0})} \oplus \mathcal{H}^{(-\sqrt{z_0})}$ as an orthogonal direct sum of $K$-linear closed subspaces.

On the other hand $Z\tilde{J} = \tilde{J}Z$, hence $\tilde{J}\mathcal{H}^{(e)} = \mathcal{H}^{(e)}$ whenever $\varepsilon \in \{\pm \sqrt{z_0}\}$.

Now let us keep $\varepsilon \in \{\pm \sqrt{z_0}\}$ fixed. We shall say that an orthonormal subset $\Sigma$ of the Hilbert space $\mathcal{H}^{(e)}$ over $K$ is a $\tilde{J}$-set if $\{\tilde{J}x, -\tilde{J}x\} \cap \Sigma \neq \emptyset$ for each $x \in \Sigma$. For every $x \in \mathcal{H}^{(e)}$ with $\|x\| = 1$ we have $(x | \tilde{J}x) = -(\tilde{J}^2x | x) = -(x | \tilde{J}x)$, whence $x \perp \tilde{J}x$, so that $\{x, \tilde{J}x\}$ is a $\tilde{J}$-set. Then Zorn’s lemma applies and shows that there exists a maximal $\tilde{J}$-set $\Sigma^{(e)}$ in the Hilbert space $\mathcal{H}^{(e)}$ over $K$.

It is easy to see that $\Sigma^{(e)}$ is actually an orthonormal basis in the Hilbert space $\mathcal{H}^{(e)}$ over $K$. In fact, let us assume that this is not the case and consider for instance the case $K = \mathbb{R}$. Then there exists $x_0 \in \mathcal{H}^{(e)}$ such that $\|x_0\| = 1$ and $\text{Re} (x | x_0) = 0$ whenever $x \in \Sigma^{(e)}$. Now for every $x \in \Sigma^{(e)}$ we have

$$\text{Re} (x | \tilde{J}x_0) = -\text{Re} (\tilde{J}^2x | x_0) = -\text{Re} (\tilde{J}x | x_0) = 0$$

since either $\tilde{J}x \in \Sigma^{(e)}$ or $-\tilde{J}x \in \Sigma^{(e)}$. It then follows that $\Sigma^{(e)} \cup \{x_0, \tilde{J}x_0\}$ is again a $\tilde{J}$-set, thus contradicting the maximality of the $\tilde{J}$-set $\Sigma^{(e)}$.

Then let $\{\xi^{(e)}_l\}_{l \geq 1}$ be the set of all $x \in \Sigma^{(e)}$ such that $-\tilde{J}x \in \Sigma^{(e)}$, and denote $\xi^{(e)}_{-l} = -\tilde{J}\xi^{(e)}_l$ for $l = 1, 2, \ldots$. Thus we get an orthonormal basis $\{\xi^{(e)}_l\}_{l \in \mathbb{Z} \setminus \{0\}}$ in the Hilbert space $\mathcal{H}$ over $K$, satisfying the wished-for properties.

We shall also need the following version of Proposition 2 in \cite{Ba69}.

**Lemma 3.6.** Let $\mathcal{H}$ be a complex separable infinite-dimensional Hilbert space with a conjugation $J: \mathcal{H} \to \mathcal{H}$. Then the following assertions hold:

(a) If $Z \in B(\mathcal{H})$ satisfies the conditions $Z\tilde{J} = \tilde{J}Z$, $Z = Z^* = Z^{-1}$, and $\dim \text{Ker}(Z - 1) = \dim \text{Ker}(Z + 1)$, then there exists an orthonormal basis $\{\xi_l\}_{l \in \mathbb{Z} \setminus \{0\}}$ in the Hilbert space $\mathcal{H}$ such that $Z\xi_l = J\xi_l = \xi_{-l}$ whenever $l \in \mathbb{Z} \setminus \{0\}$.

(b) If $\tilde{J}: \mathcal{H} \to \mathcal{H}$ is an anti-conjugation such that $J\tilde{J} = \tilde{J}J$, then there exists an orthonormal basis $\{\xi_l\}_{l \in \mathbb{Z} \setminus \{0\}}$ in the Hilbert space $\mathcal{H}$ such that $J\xi_l = \xi_{-l}$
Lemma 3.8. Let $\mathcal{H}$ be a complex separable infinite-dimensional Hilbert space with an orthonormal basis $\{\xi_l\}_{l \in \mathbb{Z} \setminus \{0\}}$. Assume that $\{\alpha_l\}_{l \in \mathbb{Z} \setminus \{0\}}$ is a bounded family of real numbers and $\varepsilon \in \mathbb{R}$, and define the self-adjoint operator

$$A = \sum_{l \in \mathbb{Z} \setminus \{0\}} \alpha_l (\cdot | \xi_l) \xi_l \in \mathcal{B}(\mathcal{H})$$

(where the sum is convergent in the strong operator topology). Then let $Z : \mathcal{H} \to \mathcal{H}$ be an $\mathbb{R}$-linear continuous operator such that $\|Zx\| = \|x\|$ whenever $x \in \mathcal{H}$ and satisfying either of the following conditions:

(a) $Z^2 = 1$, $Z\xi_l = \xi_{-l}$ whenever $l \in \mathbb{Z} \setminus \{0\}$, and $Z$ is either $\mathbb{C}$-linear or $\mathbb{C}$-antilinear;

(b) $Z^2 = -1$, $Z\xi_{\pm l} = \mp \xi_{\pm l}$ whenever $l = 1, 2, \ldots$, and $Z$ is either $\mathbb{C}$-linear or $\mathbb{C}$-antilinear.

Then we have $A = \varepsilon ZAZ^{-1}$ if and only if $\alpha_{-l} = \varepsilon \alpha_l$ whenever $l \in \mathbb{Z} \setminus \{0\}$.
Lemma 4.1. Let \( \mathcal{H}_0 \) be a complex Hilbert space and \( S = -S^\ast \in \mathcal{B}(\mathcal{H}_0) \) with finite spectrum, say \( \sigma(S) = \{\lambda_1, \ldots, \lambda_n\} \). For \( k = 1, \ldots, n \) denote by \( E_k \in \mathcal{B}(\mathcal{H}_0) \) the orthogonal projection onto \( \text{Ker}(S - \lambda_k) \). Then for every \( Z \in \mathcal{B}(\mathcal{H}_0) \) we have
\[
\int e^{\lambda Z} d\mu(t) = \sum_{k=1}^n \lambda_k Z E_k.
\]
Proof. We have $S = \sum_{k=1}^{n} \lambda_k E_k$ and $E_k E_l = 0$ whenever $k \neq l$; hence $e^{tS} = \sum_{k=1}^{n} e^{t\lambda_k} E_k$ for arbitrary $t \in \mathbb{R}$. Thence
\begin{equation}
(4.1) \quad e^{t \text{ad} S} Z = e^{tS} Z e^{-tS} = \sum_{k,l=1}^{n} e^{t(\lambda_k - \lambda_l)} E_k Z E_l.
\end{equation}

Now $\int e^{t(\lambda_k - \lambda_l)} d\mu(t) = \int e^{(t+1)(\lambda_k - \lambda_l)} d\mu(t) = e^{t(\lambda_k - \lambda_l)} \int e^{t(\lambda_k - \lambda_l)} d\mu(t)$ by the invariance property of $\mu$ (see Notation 2.1). If $k \neq l$, then $\lambda_k \neq \lambda_l$, whence $\int e^{t(\lambda_k - \lambda_l)} d\mu(t) = 0$. Then the wished-for equality follows by means of equation (4.1). \qed

Lemma 4.2. Let $\mathcal{H}$ be a separable complex Hilbert space, $\mathcal{J}$ a separable norm ideal of $\mathcal{B}(\mathcal{H})$, and $\{a_n\}_{n \geq 0}$ a sequence of self-adjoint elements of $\mathcal{B}(\mathcal{H})$ which is convergent to some $a \in \mathcal{B}(\mathcal{H})$ in the strong operator topology. Then $\lim_{n \to \infty} \|a_n x - ax\|_3 = \lim_{n \to \infty} \|x a_n - xa\|_3 = \lim_{n \to \infty} \|a_n x a_n - axa\|_3 = 0$ whenever $x \in \mathcal{J}$.

Proof. See Theorem 6.3 in Chapter III of [GK69]. \qed

In the following statement, by triangular projection associated with a self-adjoint operator we mean the triangular projection associated with its linearly ordered set of spectral projections; see [GK70, EL72, ET78, and Pi68].

Proposition 4.3. Let $X_0 = X_0^* \in \mathfrak{gl}_2$ and denote
$$\Lambda = \{ \lambda \in \mathbb{R} \mid \dim \ker(X_0 - \lambda) > 0 \},$$
and for every $\lambda \in \Lambda$ let $E_\lambda \in \mathcal{B}(\mathcal{H})$ be the orthogonal projection onto $\ker(X_0 - \lambda)$.

Then $X_0$ is an Iwasawa quasi-regular element of $\mathfrak{gl}_2$ and the following assertions hold:

1. The set $\Lambda$ is countable and $\{E_\lambda\}_{\lambda \in \Lambda}$ is a family of mutually orthogonal finite-rank projections satisfying $\sum_{\lambda \in \Lambda} E_\lambda = 1$ in the strong operator topology.
2. If $\mathcal{T}_\lambda : \mathfrak{gl}_2 \to \mathfrak{gl}_2$ stands for the triangular projection associated with $X_0$, then
$$\begin{align*}
(\mathcal{T}_\lambda)^2 &= \mathcal{T}_\lambda, \\
\text{Ran} \mathcal{T}_\lambda &= (\mathfrak{gl}_2)_{\text{ad} X_0} (\mathbb{R}_+), \\
\text{Ran} (1 - \mathcal{T}_\lambda) &\subseteq (\mathfrak{gl}_2)_{\text{ad} X_0} (-\mathbb{R}_+).
\end{align*}$$
3. Assume that we write the linear operators on $\mathcal{H}$ as infinite block matrices with respect to the partition of unity given by $\{E_\lambda\}_{\lambda \in \Lambda}$. Then for every $X \in \mathfrak{gl}_2$ the matrix of $P_{\mathfrak{gl}_2, \text{ad} (-iX_0)} X$ can be constructed out of the matrix of $X$ by replacing all the off-diagonal blocks by zeros.
4. If we denote $\mathfrak{a}_3 X_0 = \{X \in \mathfrak{gl}_2 \mid X^* = X \text{ and } [X_0, X] = 0\}$, then
$$\mathfrak{a}_3 X_0 = \{X \in \mathfrak{gl}_2 \mid X^* = X \text{ and } (\forall \lambda \in \Lambda) \ X E_\lambda \mathcal{H} \subseteq E_\lambda \mathcal{H} \}.$$
5. We have
$$\begin{align*}
(\mathfrak{gl}_2)_{\text{ad} X_0} (\mathbb{R}_+) &= \left\{ X \in \mathfrak{gl}_2 \mid (\forall \lambda \in \Lambda) \ X E_\lambda \mathcal{H} \subseteq \text{span} \left( \bigcup_{\lambda \leq \beta \in \Lambda} E_\beta \mathcal{H} \right) \right\}.
\end{align*}$$
If we denote \( n_\lambda X_0 = (\mathfrak{gl}_3)_{\text{ad}(-iX_0)}^0 \), then
\[
n_\lambda X_0 = \left\{ X \in \mathfrak{gl}_3 \mid (\forall \lambda \in \Lambda) \quad X E_\lambda \mathcal{H} \subseteq \text{span} \left( \bigcup_{\lambda, \beta \in \Lambda} E_\beta \mathcal{H} \right) \right\}.
\]

(7) The Iwasawa decomposition of \( \mathfrak{gl}_3 \) associated with \( X_0 \) is
\[
\mathfrak{gl}_3 = \mathfrak{a}_3 + n_\lambda X_0.
\]

(8) \( X_0 \) is an Iwasawa regular element of \( \mathfrak{gl}_3 \) if and only if it satisfies the condition
\[
(\forall \lambda \in \mathbb{R}) \quad \dim \ker (X_0 - \lambda) \leq 1.
\]

**Proof.** The fact that \( X_0 \) is an Iwasawa quasi-regular element will follow by Proposition 2.11 as soon as we have proved assertion (2).

Assertion (1) holds true since \( X_0 \) is a compact self-adjoint operator.

We now prove assertion (2). Since the Boyd indices of the symmetric norming function \( \Phi \) are nontrivial, it follows by Theorem 4.1 in [Ara78] that the triangular projection defines a bounded linear idempotent operator \( T_{5, X_0} : \mathfrak{gl}_3 \to \mathfrak{gl}_3 \). Let \( \mathfrak{F} \) denote the ideal of finite-rank operators on \( \mathcal{H} \). It is clear that
\[
\mathfrak{F} \cap \text{Ran} T_{5, X_0} \subseteq (\mathfrak{gl}_3)_{\text{ad} X_0}(\mathbb{R}_+) \quad \text{and} \quad \mathfrak{F} \cap \text{Ran} (1 - T_{5, X_0}) \subseteq (\mathfrak{gl}_3)_{\text{ad} X_0}(-\mathbb{R}_+).
\]

Since the ideal \( \mathfrak{F} \) is dense in \( \mathfrak{J} = \mathfrak{J}_b(0) \) and \( (T_{5, X_0})^2 = T_{5, X_0} \), it easily follows that \( \mathfrak{F} \cap \text{Ran} T_{5, X_0} \) is dense in \( \text{Ran} T_{5, X_0} \) and \( \mathfrak{F} \cap \text{Ran} (1 - T_{5, X_0}) \) is dense in \( \text{Ran} (1 - T_{5, X_0}) \). Hence
\[
\text{Ran} T_{5, X_0} \subseteq (\mathfrak{gl}_3)_{\text{ad} X_0}(\mathbb{R}_+) \quad \text{and} \quad \text{Ran} (1 - T_{5, X_0}) \subseteq (\mathfrak{gl}_3)_{\text{ad} X_0}(-\mathbb{R}_+).
\]

Thus, to complete the proof of assertion (2), it remains to show that
\[
\text{Ran} T_{5, X_0} \supseteq (\mathfrak{gl}_3)_{\text{ad} X_0}(\mathbb{R}_+).
\]

To this end let \( X \in (\mathfrak{gl}_3)_{\text{ad} X_0}(\mathbb{R}_+) \) be arbitrary. Then denote by \( \{p_n\}_{n \geq 0} \) any increasing sequence of finite-rank spectral projections of \( X_0 \) such that \( \lim_{n \to \infty} p_n = 1 \) in the strong operator topology. Then Lemma 4.2 shows that \( \lim_{n \to \infty} \|p_n X p_n - X\|_\mathfrak{J} = 0 \); hence it will be enough to check that \( p_n X p_n \in \text{Ran} T_{5, X_0} \) whenever \( n \geq 0 \). For this purpose we recall that
\[
(\mathfrak{gl}_3)_{\text{ad} X_0}(\mathbb{R}_+) = \left\{ Y \in \mathfrak{gl}_3 \mid \lim_{t \to \infty} \frac{1}{t} \log \| (\exp(-t \cdot \text{ad} X_0)) Y \| \leq 0 \right\}
\]
(see for instance Remark 1.3 in [Be85]). Since \( X \in (\mathfrak{gl}_3)_{\text{ad} X_0}(\mathbb{R}_+) \) and for every \( n \geq 0 \) we have \( (\text{ad} X_0)p_n = 0 \), it then easily follows that \( p_n X p_n \in (\mathfrak{gl}_3)_{\text{ad} X_0}(\mathbb{R}_+) \), and we have seen that this completes the proof of assertion (2).

To prove assertion (3), let \( \{p_n\}_{n \geq 0} \) be a sequence of spectral projections of \( X_0 \) as above. For every \( n \geq 0 \) we have \( (\text{ad}(-iX_0))p_n = 0 \), whences it follows at once that
\[
(\forall n \geq 0) \quad p_n (\mathcal{D}_{\mathfrak{gl}_3, \text{ad}(-iX_0)} X)p_n = \mathcal{D}_{\mathfrak{gl}_3, \text{ad}(-iX_0)}(p_n X p_n).
\]

Since \( \mathcal{D}_{\mathfrak{gl}_3, \text{ad}(-iX_0)} : \mathfrak{gl}_3 \to \mathfrak{gl}_3 \) is a continuous operator and \( \lim_{n \to \infty} \|p_n Y p_n - Y\|_\mathfrak{J} = 0 \) for all \( Y \in \mathfrak{J} \), it then follows that it suffices to obtain the wished-for conclusion for the finite-rank operators \( p_n X p_n \), where \( n \geq 0 \) is arbitrary, and in this (finite-dimensional) case we just need to apply Lemma 4.1.

Assertion (4) is a direct consequence of condition (4.2).

Assertion (5) follows at once by assertion (2).
Assertion (6) follows by assertions (5) and (3).

By using assertion (2) along with Proposition 2.11 we see that \( X_0 \) is an Iwasawa quasi-regular element of \( \mathfrak{gl}_2 \) and assertion (7) holds.

Finally, we prove assertion (8): \( X_0 \) is an Iwasawa regular element if and only if 
\([\mathfrak{a}_2, X_0, \mathfrak{a}_2, X_0] = \{0\}\), and, by using assertion (4), we see that the latter condition is equivalent to the fact that each eigenvalue of \( X_0 \) has the spectral multiplicity equal to 1, which is precisely condition (4.2). \( \square \)

We shall need the following extension of Lemma 5.2 in Chapter VI of [He01] to an infinite-dimensional setting.

**Lemma 4.4.** Let \( U \) be a real Banach-Lie group with the Lie algebra \( \mathfrak{L}(U) = u \), and assume that \( m \) and \( h \) are two closed subalgebras of \( u \) such that the direct sum decomposition \( u = m + h \) holds. Now let \( M = \langle \exp_{U}(m) \rangle \) and \( H = \langle \exp_{U}(h) \rangle \) be the corresponding subgroups of \( U \) endowed with their natural structures of connected Banach-Lie groups such that \( \mathfrak{L}(M) = m \) and \( \mathfrak{L}(H) = h \). Then the multiplication map \( \alpha: M \times H \to U \), \((m,h) \mapsto mh\), is smooth and has the property that for every \((m,h) \in M \times H\) the corresponding tangent map \( T_{(m,h)}: T_{(m,h)}(M \times H) \to T_{mh}U \) is an isomorphism of Banach spaces.

**Proof.** The statement can be proved just as in the finite-dimensional case, so we omit the details. \( \square \)

**Theorem 4.5.** Let \( X_0 = X_0^* \in \mathfrak{gl}_2 \) satisfying condition (4.2). Let \( \Lambda = \{\lambda \in \mathbb{R} \mid \dim \ker (X_0 - \lambda) = 1\} \), which is a linearly ordered set with respect to the reverse ordering of the real numbers, and for every \( \lambda \in \Lambda \), pick \( \xi_\lambda \in \ker (X_0 - \lambda) \) with \( \|\xi_\lambda\| = 1 \). Now consider the Banach-Lie group \( G := \text{GL}_2(H) \) and its subgroups

\[
K := \{k \in G \mid k^* = k^{-1}\},
A := \{a \in G \mid (\forall \lambda \in \Lambda) \quad a\xi_\lambda \in \mathbb{R}_+^+\xi_\lambda\}, \text{ and }
N := \{n \in G \mid (\forall \lambda \in \Lambda) \quad n\xi_\lambda \in \xi_\lambda + \text{span}\{\xi_\beta \mid \beta < \lambda\}\}.
\]

Then \( K, A, \) and \( N \) are Banach-Lie subgroups of \( G \), and the multiplication map

\[
m: K \times A \times N \to G, \quad (k, a, n) \mapsto kan,
\]

is a diffeomorphism. In addition, both subgroups \( A \) and \( N \) are simply connected and \( AN = NA \).

**Proof.** For every \( \lambda \in \Lambda \) denote by \( e_\lambda = (\cdot \mid \xi_\lambda)\xi_\lambda \) the orthogonal projection onto the one-dimensional subspace spanned by \( \xi_\lambda \). Then it is easy to see that

\[
A = \{g \in \text{GL}_2 \mid g \geq 0; (\forall \lambda \in \Lambda) \quad e_\lambda g = ge_\lambda\};
\]

hence Proposition 3.9 shows that \( A \) is a Banach-Lie subgroup of \( G \). Furthermore, the fact that \( K \) is a Banach-Lie subgroup of \( G \) follows, e.g., by Proposition 9.28(ii) in [Be96]. As regards \( N \), let us consider the Banach algebra \( \mathfrak{B} = \mathbb{C}1 + \mathfrak{J} \), and note that

\[
N = \{n \in \mathfrak{B}^\times \mid (\forall \lambda, \beta \in I, \lambda > \beta) \quad (n\xi_\lambda \mid \xi_\beta) = 0; (\forall \lambda \in \Lambda) \quad (n\xi_\lambda \mid \xi_\lambda) = 1; (\forall \lambda \in \Lambda) \quad np_\lambda = p_\lambda np_\lambda\};
\]
hence $N$ is an algebraic subgroup of $\mathfrak{B}^\times$, and thus it is a Banach-Lie subgroup of $\mathfrak{B}^\times$ by the Harris-Kaup theorem (see [HK77] or Theorem 4.13 in [Bed06]). Since $N \subseteq G$ and $G$ is a Banach-Lie subgroup of $\mathfrak{B}^\times$, it follows that $N$ is a Banach-Lie subgroup of $G$ as well.

Now note that $L(G) = \mathfrak{g}_1$, $L(K) = u_1$, $L(A) = a_3, X_0$, and $L(N) = n_3, X_0$ with the notation of Proposition 4.3. By using Proposition 3.9 it is easy to show that $B := AN$ is a Banach-Lie subgroup of $G$ such that the multiplication mapping sets up a diffeomorphism $A \times N \rightarrow AN = B$. In addition, the Lie algebra of $B$ decomposes as $L(B) = a_3, X_0 + n_3, X_0$. It then follows by Lemma 4.4 and Proposition 4.3(7) that the multiplication mapping $m: K \times A \times N \rightarrow G$, $(k, a, n) \mapsto kan$, is regular, in the sense that its tangent map $T_{(k,a,n)}m: T_{(k,a,n)}(K \times A \times N) \rightarrow T_{kan}G$ is an isomorphism of Banach spaces for every $k \in K$, $a \in A$, and $n \in N$.

Now define
\[
\psi: [0, 1] \times (A \times N) \rightarrow A \times N, \quad \psi(t, a, n) = ((1 - t)a + t1, 1 + (1 - t)(n - 1)).
\]
Clearly $1 + (1 - t)(n - 1) \in N$ whenever $n \in N$ and $t \in [0, 1]$. On the other hand, for arbitrary $t \in (0, 1]$ and $a \in A$ we have $(1 - t)a + t1 \geq t1$; hence $(1 - t)a + t1$ is a positive invertible operator; besides, $(1 - t)a + t1 = a + t(1 - a) \in \mathbb{1} + \mathfrak{g}_1^0(\mathcal{H})$, so that $(1 - t)a + t1 \in A$. Consequently, the mapping $\psi$ is well defined. In addition, $\psi$ is continuous, $\psi(0, \cdot) = \text{id}_{A \times N}$, and $\psi(1, \cdot)$ is a constant mapping of $A \times N$ into itself. Thus we see that both $A$ and $N$ are contractible topological spaces.

Since $K \cap AN = \{1\}$, it is easy to see that the map $m: K \times A \times N \rightarrow G$ is injective. We have seen above that the mapping $m$ is regular at every point, and it then follows that $m$ is a diffeomorphism of $K \times A \times N$ onto some open subset of $G$.

To prove that the multiplication mapping $m$ is actually surjective, let $g \in G$ be arbitrary and consider the nest $\mathfrak{Y} = \{p_\lambda\}_{\lambda \in \Lambda}$, where $p_\lambda$ is the orthogonal projection onto the subspace $\mathcal{H}_\lambda = \operatorname{span}\{\xi_\beta \mid \beta \leq \lambda\}$ of $\mathcal{H}$ whenever $\lambda \in \Lambda$. Then Corollary 4.2 shows that there exist a unitary element $w \in \mathbb{1} + \mathfrak{J}$ and an element $b \in (\text{Alg}\, \mathfrak{Y})^\times \cap (1 + \mathfrak{J})$ such that $g = wb$. Now for every $\lambda \in \Lambda$ define $b_\lambda := (b_\lambda \mid \xi_\lambda)$. We have sup $|b_\lambda| \leq \|v\| < \infty$, so that there exists an operator $d \in B(\mathcal{H})$ such that
\[
(d\xi_\lambda \mid \xi_\beta) = \begin{cases} b_\lambda & \text{if } \lambda = \beta, \\ 0 & \text{if } \lambda \neq \beta. \end{cases}
\]
Since $b \in (\text{Alg}\, \mathfrak{Y})^\times \cap (1 + \mathfrak{J})$, it follows at once that $d \in (\text{Alg}\, \mathfrak{Y})^\times \cap (1 + \mathfrak{J})$ as well, and then $d^{-1}b \in N$.
Now let $d = u|d|$ be the polar decomposition of $d$. Then $u, |d| \in G$ by Lemma 5.1 in [BR05] again, so that $g = wb = wu|d|(d^{-1}b) \in KAN$, and the proof ends. \hfill \Box

**Real groups of type AI.**

**Theorem 4.6.** Let $J: \mathcal{H} \rightarrow \mathcal{H}$ be a conjugation and $\{\xi_l\}_{l \in \mathbb{Z}\setminus\{0\}}$ be an orthonormal basis in $\mathcal{H}$ such that $J\xi_l = \xi_l$ whenever $l \in \mathbb{Z}\setminus\{0\}$. Pick a family of mutually different real numbers $\{\alpha_l\}_{l \in \mathbb{Z}\setminus\{0\}}$ such that $\lim_{l \rightarrow \pm \infty} \alpha_l = 0$ and $\Phi(\alpha_1, \alpha_{-1}, \alpha_2, \alpha_{-2}, \ldots) < \infty$, and define the self-adjoint operator
\[
X_0 = \sum_{l \in \mathbb{Z}\setminus\{0\}} \alpha_l(\cdot \mid \xi_l)\xi_l \in B(\mathcal{H}).
\]
Then \( X_0 \) is an Iwasawa regular element of \( \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}) \) and the Iwasawa decomposition of \( \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}) \) associated with \( X_0 \) is

\[
(4.3) \quad \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}) = (u_3 \cap \mathfrak{gl}_3(\mathcal{H}; \mathbb{R})) + (a_3, x_0 \cap \mathfrak{gl}_3(\mathcal{H}; \mathbb{R})) + (n_3, x_0 \cap \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}))
\]

(where \( u_3, a_3, x_0 \), and \( n_3, x_0 \) are the ones defined in Proposition 4.3).

Moreover, if \( G \) stands for the connected 1-component of \( \text{GL}_3(\mathcal{H}; \mathbb{R}) \), then there exists a global Iwasawa decomposition \( m: K \times A \times N \to G \) corresponding to (4.3).

In addition we have \( AN = NA \), and both groups \( A \) and \( N \) are simply connected.

**Proof.** The role of the orthonormal basis \( \{ \xi_l \}_{l \in \mathbb{Z} \setminus \{0\}} \) as in the statement can be played by any orthonormal basis in the real Hilbert space \( \mathcal{H}_\mathbb{R} = \{ x \in \mathcal{H} \mid Jx = x \} \).

The conditions satisfied by the family \( \{ \alpha_l \}_{l \in \mathbb{Z} \setminus \{0\}} \) ensure that \( X_0 = X_0^3 \in \mathcal{I} \). In addition, it is straightforward to check that actually \( X_0 \in \mathfrak{gl}_3(\mathcal{H}, \mathbb{R}) \) (see for instance the proof of Lemma 3.8(a)).

On the other hand, it follows by Proposition 4.3 that \( X_0 \) is an Iwasawa quasi-regular element of \( \mathfrak{gl}_3 \) and the Iwasawa decomposition of \( \mathfrak{gl}_3 \) associated with \( X_0 \) is

\[
\mathfrak{gl}_3 = u_3 + a_3, x_0 + n_3, x_0.
\]

To obtain the Iwasawa decomposition asserted for \( \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}) \) we are going to use Corollary 2.13 with \( \overline{g} = \mathfrak{gl}_3, \, \overline{g}_0 = \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}) \), and \( \overline{T} = T_3, x_0: \mathfrak{gl}_3 \to \mathfrak{gl}_3 \) the triangular projection associated with \( X_0 \). To this end we have to prove that \( T_3, x_0(\mathfrak{gl}_3(\mathcal{H}; \mathbb{R}))) \subseteq \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}). \)

In order to do so, we denote \( \mathcal{H}_r = \text{span} \{ \xi_1, \xi_{-1}, \xi_2, \xi_{-2}, \ldots, \xi_r, \xi_{-r} \} \) and let \( P_r: \mathcal{H} \to \mathcal{H} \) be the orthogonal projection onto \( \mathcal{H}_r \) for \( r = 1, 2, \ldots \). Then for arbitrary \( X \in \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}) \subseteq \mathcal{I} \) we have \( \lim_{r \to \infty} \parallel P_r XP_r - X \parallel_3 = 0 \) by Lemma 4.2 and hence \( \lim_{r \to \infty} \parallel T_3, x_0(P_r XP_r) - T_3, x_0(X) \parallel_3 = 0 \). Thus it will be enough to show that \( T_3, x_0(P_r XP_r) \in \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}) \) whenever \( r \geq 1 \), and this follows by the restricted root space decomposition of the finite-dimensional real reductive Lie algebras \( \mathfrak{gl}(\mathcal{H}_r; \mathbb{R}) \cong \mathfrak{gl}(r, \mathbb{R}) \) for \( r = 1, 2, \ldots \).

Thus \( X_0 \) is an Iwasawa quasi-regular element of \( \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}) \). Since \( X_0 \) satisfies condition (4.2), it follows that it is actually Iwasawa regular in \( \mathfrak{gl}_3 \), hence also in \( \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}) \).

To obtain the global Iwasawa decomposition, let us denote by \( B \) the connected 1-component of \( \text{GL}_3(\mathcal{H}; \mathbb{R}) \). We are going to apply Proposition 2.15 with \( G = \overline{C}, \overline{K}, \overline{A}, \) and \( \overline{N} \) as in Theorem 4.5. For this purpose let us denote by \( C \) the connected 1-component of \( C \cap \text{GL}_3(\mathcal{H}; \mathbb{R}) \) for \( C \in \{ K, A, N \} \). Then \( C \) will be a connected Lie subgroup of \( \overline{G} = \text{GL}_3 \), since \( C \cap \text{GL}_3(\mathcal{H}; \mathbb{R}) \) is a Lie subgroup of \( \text{GL}_3 \). (The latter property follows by the Harris-Kaup theorem if \( C = K \) or \( C = N \), and from Proposition 3.9 if \( C = A \).) It is clear that \( L(G) = \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}), L(K) = u_3 \cap \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}), L(A) = a_3, x_0 \cap \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}), \) and \( L(N) = n_3, x_0 \cap \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}) \); hence \( L(G) = L(K) + L(A) + L(N) \). Next define \( E_r: \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}) \to \mathfrak{gl}_3(\mathcal{H}; \mathbb{R}), X \mapsto P_r XP_r \) for \( r = 1, 2, \ldots \). Now it is easy to see that Proposition 2.15 can be applied, and this completes the proof.

**Real groups of type AII.**

**Theorem 4.7.** Let \( \overline{J}: \mathcal{H} \to \mathcal{H} \) be an anti-conjugation and \( \{ \xi_l \}_{l \in \mathbb{Z} \setminus \{0\}} \) be an orthonormal basis in \( \mathcal{H} \) such that \( \overline{J} \xi_{\pm l} = \mp \xi_{\pm l} \) for \( l = 1, 2, \ldots \). Pick a family of real...
numbers \(\{\alpha_l\}_{l \in \mathbb{Z} \setminus \{0\}}\) such that the numbers \(\{\alpha_l\}_{l \geq 1}\) are mutually different and \(\alpha_{l-1} = \alpha_l\) for all \(l \in \mathbb{Z} \setminus \{0\}\), \(\lim_{l \to \infty} \alpha_l = 0\), and \(\Phi(\alpha_1, \alpha_{-1}, \alpha_2, \alpha_{-2}, \ldots) < \infty\), and define the self-adjoint operator
\[
X_0 = \sum_{l \in \mathbb{Z} \setminus \{0\}} \alpha_l (\cdot | \tilde{\xi}_l)\tilde{\xi}_l \in B(\mathcal{H}).
\]
Then \(X_0\) is an Iwasawa regular element of \(\mathfrak{gl}_2(\mathcal{H}; \mathbb{H})\) and the Iwasawa decomposition of \(\mathfrak{gl}_2(\mathcal{H}; \mathbb{H})\) associated with \(X_0\) is
\[
\mathfrak{gl}_2(\mathcal{H}; \mathbb{H}) = (\mathfrak{u}_3 \cap \mathfrak{gl}_2(\mathcal{H}; \mathbb{H})) + (\mathfrak{a}_3, \mathfrak{x}_0 \cap \mathfrak{gl}_2(\mathcal{H}; \mathbb{H})) + (\mathfrak{n}_3, \mathfrak{x}_0 \cap \mathfrak{gl}_2(\mathcal{H}; \mathbb{H}))
\]
(\text{where } \mathfrak{u}_3, \mathfrak{a}_3, \mathfrak{x}_0, \text{ and } \mathfrak{n}_3, \mathfrak{x}_0 \text{ are the ones defined in Proposition 4.3}). Moreover, there exists a global Iwasawa decomposition \(\mathbf{m}: K \times A \times N \to \text{GL}_2(\mathcal{H}; \mathbb{H})\) corresponding to \(\{3\}\). In addition we have \(AN = NA\), and both groups \(A\) and \(N\) are simply connected.

Proof. The orthonormal basis \(\{\tilde{\xi}_l\}_{l \in \mathbb{Z} \setminus \{0\}}\) as in the statement exists according to Lemma 3.7(a). The hypothesis on \(\{\alpha_l\}_{l \in \mathbb{Z} \setminus \{0\}}\) implies that \(X_0 = X_0^* \in \mathfrak{J}\), and then \(X_0 \in \mathfrak{gl}_2(\mathcal{H}; \mathbb{H})\) by Lemma 3.8(b).

To see that \(X_0\) is an Iwasawa quasi-regular element of \(\mathfrak{gl}_2(\mathcal{H}; \mathbb{H})\) and the corresponding Iwasawa decomposition looks as asserted, one can proceed just as in the proof of Theorem 4.6 this time using the orthogonal projection \(\tilde{P}_r: \mathcal{H} \to \mathcal{H}\) onto the subspace \(\mathcal{H}_r = \text{span} \{\tilde{\xi}_1, \tilde{\xi}_2, \tilde{\xi}_2, \ldots, \tilde{\xi}_r, \tilde{\xi}_{-r}\}\) for \(r = 1, 2, \ldots\). We omit the details.

It remains to check that \(X_0\) is actually an Iwasawa regular element of \(\mathfrak{gl}_2(\mathcal{H}; \mathbb{H})\). To this end denote \(\tilde{V}_l = \mathbb{C}\tilde{\xi}_l + \mathbb{C}\tilde{\xi}_{-l}\) for \(l = 1, 2, \ldots\), and let \(X = X^* \in \mathfrak{gl}_2(\mathcal{H}; \mathbb{H})\) with \([X, X_0] = 0\). Since the real numbers \(\{\alpha_l\}_{l \geq 1}\) are mutually different and \([X, X_0] = 0\), it follows that \(X\tilde{V}_l \subseteq \tilde{V}_l\) whenever \(l \geq 1\). Now, since \(X = X^*\), it follows that for each \(l \geq 1\) there exists an eigenvector \(v_l \in \tilde{V}_l \setminus \{0\}\) of \(X|_{\tilde{V}_l}\). Let \(\gamma_l \in \mathbb{R}\) be the corresponding eigenvalue, so that \(Xv_l = \gamma_l v_l\). On the other hand the anti-conjugation \(\mathfrak{J}\) satisfies \(\mathfrak{J}\tilde{V}_l \subseteq \tilde{V}_l\); hence \(\tilde{V}_l\) has the natural structure of a quaternionic vector space. Since \(\dim_{\mathbb{C}} \tilde{V}_l = 2\) it follows that \(\dim_{\mathbb{H}} \tilde{V}_l = 1\); hence \(\tilde{V}_l = \mathbb{H}v_l\). Now the operator \(X \in \mathfrak{gl}_2(\mathcal{H}; \mathbb{H})\) is \(\mathbb{C}\)-linear and \(\mathfrak{J}X = X\mathfrak{J}\); hence for every \(q \in \mathbb{H}\) we have \(X(qv_l) = qXv_l = q\gamma_l v_l = \gamma_l(qv_l)\), so that \(X\xi = \gamma_l\xi\) whenever \(\xi \in \tilde{V}_l\).

Since \(\mathcal{H} = \bigoplus_{l \geq 1} \tilde{V}_l\), it then follows that \([X_1, X_2] = 0\) for \(X_j = X_j^* \in \mathfrak{gl}_2(\mathcal{H}; \mathbb{H})\) and \([X_j, X_0] = 0\) for \(j = 1, 2\).

To prove the assertion on the global Iwasawa decomposition one can use Proposition 2.15 in a fashion similar to that of the proof of Theorem 4.6.

Real groups of type AIII.

**Theorem 4.8.** Assume that \(\mathcal{H} = \mathcal{H}_+ \oplus \mathcal{H}_-\) is an orthogonal direct sum decomposition with \(\dim \mathcal{H}_+ = \dim \mathcal{H}_-\), and let \(\{e^\pm_l\}_{l \geq 1}\) be an orthonormal basis in \(\mathcal{H}_+\).

Then define \(f^+_l = (e^+_l \pm e^-_l)/\sqrt{2}\) whenever \(l \geq 1\). Pick a family of real numbers \(\{\lambda_l\}_{l \geq 1}\) such that
\[
\lambda_l \neq \pm \lambda_j \text{ if } j \neq l, \quad \lim_{l \to \infty} \lambda_l = 0, \quad \text{and } \Phi(\lambda_1, -\lambda_1, \lambda_2, -\lambda_2, \ldots) < \infty,
\]
and define the self-adjoint operator

\[ X_0 := \sum_{i \geq 1} \lambda_i \left( \cdot | f_i^+ \right) f_i^+ - \left( \cdot | f_i^- \right) f_i^- ) . \]

Then \( X_0 \) is an Iwasawa regular element of \( u_2(\mathcal{H}_+, \mathcal{H}_-) \) and the corresponding Iwasawa decomposition is

\[
\begin{align*}
\mathfrak{u}_2(\mathcal{H}_+, \mathcal{H}_-) &= (\mathfrak{u}_2 \cap \mathfrak{u}_2(\mathcal{H}_+, \mathcal{H}_-)) + (\mathfrak{n}_2, \mathfrak{u}_2(\mathcal{H}_+, \mathcal{H}_-)) \\
&+ (\mathfrak{n}_2, \mathfrak{u}_2(\mathcal{H}_+, \mathcal{H}_-))
\end{align*}
\]

(4.5)

where \( \mathfrak{u}_2, \mathfrak{n}_2, \mathfrak{u}_2(\mathcal{H}_+, \mathcal{H}_-) \) are the ones defined in Proposition 4.3.

Moreover, if \( G \) stands for the connected 1-component of \( \mathfrak{u}_2(\mathcal{H}_+, \mathcal{H}_-) \), then there exists a global Iwasawa decomposition \( \mathfrak{m} : K \times A \times N \to G \) corresponding to \( \mathfrak{u}_2 \).

In addition we have \( AN = NA \), and both groups \( A \) and \( N \) are simply connected.

Proof. To begin with, note that \( \bigcup_{i \geq 1} \{ f_i^+, f_i^- \} \) is an orthonormal basis in \( \mathcal{H} \). It then follows by the hypothesis on \( \{ \lambda_i \}_{i \geq 1} \) along with Proposition 4.3 that \( X_0 \) is an Iwasawa regular element of \( \mathfrak{gl}_2 \). We now show that actually \( X_0 \in u_2(\mathcal{H}_+, \mathcal{H}_-) \). For this purpose denote \( V = (1, 0, 0)^T \) as in Definition 3.2. Then for all \( j \geq 1 \) we have

\[ V e_j^\pm = \pm e_j^\pm, \quad \text{whence} \quad V f_j^\pm = f_j^\mp. \]

This implies that for every \( \xi \in \mathcal{H} \) we have

\[ (\xi | f_j^\pm) f_j^\pm = (\xi | V f_j^\mp) f_j^\mp = V((\xi | f_j^\mp) f_j^\mp). \]

Thus \( X_0 = -VX_0V \), whence \( VX_0V = -VX_0 \), and then \( X_0 \in u_2(\mathcal{H}_+, \mathcal{H}_-) \).

Now the wished-for conclusion will follow by Corollary 2.15 as soon as we have proved that the triangular projection \( T_{\mathcal{J}, \mathcal{X}_0} : \mathcal{J} \to \mathcal{J} \) leaves \( u_2(\mathcal{H}_+, \mathcal{H}_-) \) invariant.

To this end, for \( r = 1, 2, \ldots \), denote \( \mathcal{H}_r = \text{span} \{ e_1^+, \ldots, e_r^+ \} \) and let \( P_r : \mathcal{H} \to \mathcal{H} \) be the orthogonal projection onto \( \mathcal{H}_r \). For \( X \in u_2(\mathcal{H}_+, \mathcal{H}_-) \subseteq \mathcal{J} \) we have

\[ \lim_{r \to \infty} \| P_r X P_r - X \| = 0. \]

Thus it will be enough to show that \( T_{\mathcal{J}, \mathcal{X}_0}(P_r X P_r) \in u_2(\mathcal{H}_+, \mathcal{H}_-) \) whenever \( r \geq 1 \), and this follows by the restricted-root space decomposition of the finite-dimensional real reductive Lie algebras \( u(\mathcal{H}_r \cap \mathcal{H}_+, \mathcal{H}_r \cap \mathcal{H}_-) \cong u(\mathcal{H}_r, \mathcal{H}_r) \) for \( r = 1, 2, \ldots \).

To prove the assertion on the global Iwasawa decomposition one can use Proposition 2.15 in a fashion similar to that of the proof of Theorem 4.6.

5. Iwasawa Decompositions for Groups of Type B

As in Section 4 we let \( \mathcal{H} \) be a complex separable infinite-dimensional Hilbert space, \( \Phi \) a mononormalizing symmetric norming function whose Boyd indices are nontrivial, and let \( \mathcal{J} = \mathcal{G}_0(\Phi) \subseteq \mathcal{B}(\mathcal{H}) \) denote the corresponding separable norm ideal. We shall use the methods of Section 2 to get global Iwasawa decompositions for classical groups of type B associated with the operator ideal \( \mathcal{J} \).

Complex groups of type B.

**Theorem 5.1.** Let \( \mathcal{J} : \mathcal{H} \to \mathcal{H} \) be a conjugation and \( \{ \xi_l \}_{l \in \mathbb{Z} \setminus \{0\}} \) be an orthonormal basis in \( \mathcal{H} \) such that \( J\xi_l = \xi_{-1} \) whenever \( l \in \mathbb{Z} \setminus \{0\} \). Pick a family of mutually different real numbers \( \{ \alpha_l \}_{l \in \mathbb{Z} \setminus \{0\}} \) satisfying the conditions

\[ \alpha_{-l} = -\alpha_l \quad \text{for all} \quad l \in \mathbb{Z} \setminus \{0\}, \quad \lim_{l \to \infty} \alpha_l = 0, \quad \text{and} \quad \Phi(\alpha_1, \alpha_{-1}, \alpha_2, \alpha_{-2}, \ldots) < \infty, \]

License or copyright restrictions may apply to redistribution; see http://www.ams.org/journal-terms-of-use
and define the self-adjoint operator

\[ X_0 = \sum_{\ell \in \mathbb{Z} \setminus \{0\}} \alpha_\ell (\cdot | \xi_\ell) \xi_\ell \in \mathcal{B}(\mathcal{H}). \]

Then \( X_0 \) is an Iwasawa regular element of \( \mathfrak{o}_3 \) and the Iwasawa decomposition of \( \mathfrak{o}_3 \) associated with \( X_0 \) is

\[ \mathfrak{o}_3 = (u_3 \cap \mathfrak{o}_3) + (\mathfrak{a}_3, X_0 \cap \mathfrak{o}_3) + (\mathfrak{n}_3, X_0 \cap \mathfrak{o}_3) \]  

(5.1)

(where \( u_3, \mathfrak{a}_3, X_0 \), and \( \mathfrak{n}_3 \) are the ones defined in Proposition 4.3).

Moreover, if \( G \) stands for the connected \( 1 \)-component of \( O_3 \), then there exists a global Iwasawa decomposition \( m: K \times A \times N \to G \) corresponding to (5.1). In addition we have \( AN = NA \), and both groups \( A \) and \( N \) are simply connected.

**Proof.** Recall that the existence of the orthonormal basis \( \{ \xi_\ell \}_{\ell \in \mathbb{Z} \setminus \{0\}} \) as in the statement follows by Lemma (3.7) (a). The conditions satisfied by the family \( \{ \alpha_\ell \}_{\ell \in \mathbb{Z} \setminus \{0\}} \) ensure that \( X_0 = X_0^* \in \mathfrak{j} \). In addition, it follows by Lemma (3.8) that actually \( X_0 \in \mathfrak{o}_3 \).

On the other hand, since the real numbers in the family \( \{ \alpha_\ell \}_{\ell \in \mathbb{Z} \setminus \{0\}} \) are mutually different, it follows by Proposition (1.23) that \( X_0 \) is an Iwasawa regular element of \( \mathfrak{gl}_3 \) and the Iwasawa decomposition of \( \mathfrak{gl}_3 \) associated with \( X_0 \) is \( \mathfrak{gl}_3 = u_3 + \mathfrak{a}_3, X_0 + \mathfrak{n}_3, X_0 \).

To obtain the conclusion we are going to use Corollary (2.12) for \( \tilde{g} = \mathfrak{gl}_3 \), \( \mathfrak{g} = \mathfrak{o}_3 \), and \( \mathcal{T} = \mathfrak{T}_3, X_0: \mathfrak{gl}_3 \to \mathfrak{gl}_3 \). To this end it remains to prove that \( \mathfrak{T}_3, X_0(\mathfrak{o}_3) \subseteq \mathfrak{o}_3 \).

Denote \( \mathcal{H}_r = \text{span} \{ \xi_1, \xi_{-1}, \xi_2, \xi_{-2}, \ldots, \xi_r, \xi_{-r} \} \) for \( r \geq 1 \). Also let \( P_r: \mathcal{H} \to \mathcal{H} \) be the orthogonal projection onto \( \mathcal{H}_r \) for \( r = 1, 2, \ldots \) Then for arbitrary \( X \in \mathfrak{o}_3 \) we have \( \lim_{r \to \infty} \| P_r X P_r - X \|_3 = 0 \) by Lemma (1.2) hence

\[ \lim_{r \to \infty} \| \mathfrak{T}_3, X_0(P_r X P_r) - \mathfrak{T}_3, X_0(X) \|_3 = 0. \]

Thus it will be enough to show that \( \mathfrak{T}_3, X_0(P_r X P_r) \in \mathfrak{o}_3 \) whenever \( r \geq 1 \), and this follows by the restricted-root space decomposition of the finite-dimensional complex reductive Lie algebras \( \mathfrak{o}(\mathcal{H}_r) \simeq \mathfrak{o}(r, \mathbb{C}) \) for \( r = 1, 2, \ldots \).

To prove the assertion on the global Iwasawa decomposition one can use Proposition (2.15) in a fashion similar to that of the proof of Theorem 4.6. \( \square \)

**Real groups of type BI.**

**Theorem 5.2.** Assume \( \mathcal{H} = \mathcal{H}_+ \oplus \mathcal{H}_- \) with \( \dim \mathcal{H}_+ = \dim \mathcal{H}_- \) and let \( J: \mathcal{H} \to \mathcal{H} \) be a conjugation such that \( J(\mathcal{H}_\pm) \subseteq \mathcal{H}_\pm \). Also let \( V = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \) with respect to this orthogonal direct sum decomposition of \( \mathcal{H} \). Then let \( \{ \xi_\ell \}_{\ell \in \mathbb{Z} \setminus \{0\}} \) be an orthonormal basis in \( \mathcal{H} \) such that \( J\xi_\ell = V\xi_\ell = \xi_{-\ell} \) whenever \( \ell \in \mathbb{Z} \setminus \{0\} \). Pick a family of mutually different real numbers \( \{ \alpha_\ell \}_{\ell \in \mathbb{Z} \setminus \{0\}} \) satisfying the conditions

\[ \alpha_{-\ell} = -\alpha_\ell \text{ for all } \ell \in \mathbb{Z} \setminus \{0\}, \quad \lim_{l \to \infty} \alpha_l = 0, \quad \text{and} \quad \Phi(\alpha_1, \alpha_{-1}, \alpha_2, \alpha_{-2}, \ldots) < \infty, \]

and define the self-adjoint operator

\[ X_0 = \sum_{\ell \in \mathbb{Z} \setminus \{0\}} \alpha_\ell (\cdot | \xi_\ell) \xi_\ell \in \mathcal{B}(\mathcal{H}). \]
Then $X_0$ is an Iwasawa regular element of $\mathfrak{o}_3(\mathcal{H}_+, \mathcal{H}_-)$ and the corresponding Iwasawa decomposition is
\begin{equation}
\mathfrak{o}_3(\mathcal{H}_+, \mathcal{H}_-) = (u_3 \cap \mathfrak{o}_3(\mathcal{H}_+, \mathcal{H}_-)) \oplus (a_3, X_0 \cap \mathfrak{o}_3(\mathcal{H}_+, \mathcal{H}_-)) \\
+ (n_3, X_0 \cap \mathfrak{o}_3(\mathcal{H}_+, \mathcal{H}_-))
\end{equation}
(where $u_3$, $a_3, X_0$, and $n_3, X_0$ are the ones defined in Proposition 4.3).

Moreover if $G$ stands for the connected 1-component of $O_3(\mathcal{H}_+, \mathcal{H}_-)$, then there exists a global Iwasawa decomposition $m: K \times A \times N \to G$ corresponding to (5.2). In addition we have $AN = NA$, and both groups $A$ and $N$ are simply connected.

Proof. The existence of the orthonormal basis \{\xi_l\}_{l \in \mathbb{Z}\setminus \{0\}} as in the statement follows by Lemma 3.6. The conditions satisfied by the family of real numbers \{\alpha_l\}_{l \in \mathbb{Z}\setminus \{0\}} ensure that $X_0 = X_0^0 \in \mathfrak{I}$. In addition, it follows by Lemma 3.8(a) that we actually have $X_0 \in \mathfrak{o}_3(\mathcal{H}_+, \mathcal{H}_-)$. On the other hand, since the real numbers in the family \{\alpha_l\}_{l \in \mathbb{Z}\setminus \{0\}} are mutually different, it follows by Proposition 4.3 that $X_0$ is an Iwasawa regular element of $\mathfrak{gl}_3$ and the corresponding Iwasawa decomposition is $\mathfrak{gl}_3 = u_3 + a_3, X_0 + n_3, X_0$. Thus the conclusion will follow by applying Corollary 2.13 for the data $\mathfrak{g} = \mathfrak{gl}_3$, $\mathfrak{g}_0 = \mathfrak{o}_3(\mathcal{H}_+, \mathcal{H}_-)$, and $\mathcal{T} = T_{3, X_0}: \mathfrak{gl}_3 \to \mathfrak{gl}_3$. To this end it only remains to prove that $T_{3, X_0}(\mathfrak{o}_3(\mathcal{H}_+, \mathcal{H}_-)) \subseteq \mathfrak{o}_3(\mathcal{H}_+, \mathcal{H}_-)$. In order to do so, we denote
\[ \mathcal{H}_r = \text{span}\{\xi_1, \xi_{-1}, \xi_2, \xi_{-2}, \ldots, \xi_r, \xi_{-r}\} \text{ whenever } r \geq 1. \]
Also let $P_r: \mathcal{H} \to \mathcal{H}_r$ be the orthogonal projection onto $\mathcal{H}_r$, for $r = 1, 2, \ldots$. Then for arbitrary $X \in \mathfrak{o}_3 \subseteq \mathfrak{I}$ we have $\lim_{r \to \infty} \|P_rXP_r - X\|_2 = 0$ by Lemma 4.2 hence
\[ \lim_{r \to \infty} \|T_{3, X_0}(P_rXP_r) - T_{3, X_0}(X)\|_2 = 0. \]
Thus it will be enough to show that $T_{3, X_0}(P_rXP_r) \in \mathfrak{o}_3(\mathcal{H}_+, \mathcal{H}_-)$ whenever $r \geq 1$, and this follows by the restricted-root space decomposition of the finite-dimensional real reductive Lie algebras $\mathfrak{o}(\mathcal{H}_r \cap \mathcal{H}_+, \mathcal{H}_r \cap \mathcal{H}_-) \approx \mathfrak{o}(r, r)$ for $r = 1, 2, \ldots$.

To prove the assertion on the global Iwasawa decomposition one can use Proposition 2.15 in a fashion similar to that of the proof of Theorem 4.6. \hfill \Box

Real groups of type BII.

Theorem 5.3. Let $J: \mathcal{H} \to \mathcal{H}$ be a conjugation and $\tilde{J}: \mathcal{H} \to \mathcal{H}$ be an anti-conjugation such that $J\tilde{J} = JJ$. Then let \{\xi_l\}_{l \in \mathbb{Z}\setminus \{0\}} be an orthonormal basis in the Hilbert space $\mathcal{H}$ such that $J\xi_l = -\xi_{-l}$ whenever $l \in \mathbb{Z}\setminus \{0\}$, and $J\xi_{\pm (2s-1)} = \xi_{\mp 2s}$ and $\tilde{J}\xi_{\pm 2s} = -\xi_{\mp (2s-1)}$ for $s = 1, 2, \ldots$.

Pick a family of real numbers \{\alpha_l\}_{l \in \mathbb{Z}\setminus \{0\}} such that $\alpha_{-l} = -\alpha_l$ for all $l \in \mathbb{Z}\setminus \{0\}$, $\alpha_{2s-1} \neq \pm \alpha_{2s-1}$ whenever $s \neq t$ and $s, t \geq 1$, $\alpha_{2s-1} = -\alpha_{2s}$ for $s \geq 1, 2, \ldots$, $l \to \infty \alpha_l = 0$, and $\Phi(\alpha_1, \alpha_{-1}, \alpha_2, \alpha_{-2}, \ldots) < \infty$, and define the self-adjoint operator
\[ X_0 = \sum_{l \in \mathbb{Z}\setminus \{0\}} \alpha_l (\cdot, \xi_l) \xi_l \in \mathcal{B}(\mathcal{H}). \]

Then $X_0$ is an Iwasawa regular element of $\mathfrak{o}_3^+(\mathcal{H})$ and the corresponding Iwasawa decomposition is
\begin{equation}
\mathfrak{o}_3^+(\mathcal{H}) = (u_3 \cap \mathfrak{o}_3^+(\mathcal{H})) \oplus (a_3, X_0 \cap \mathfrak{o}_3^+(\mathcal{H})) + (n_3, X_0 \cap \mathfrak{o}_3^+(\mathcal{H}))
\end{equation}
(where $u_3$, $a_3, X_0$, and $n_3, X_0$ are the ones defined in Proposition 4.3).
Moreover, if $G$ stands for the connected 1-component of $O_3^+(H)$, then there exists a global Iwasawa decomposition $m$: $K \times A \times N \to G$ corresponding to (5.3). In addition we have $AN = NA$, and both groups $A$ and $N$ are simply connected.

Proof. The existence of the orthonormal basis $\{\xi_l\}_{l \in \mathbb{Z}\setminus\{0\}}$ as in the statement follows by Lemma 3.6. Moreover, by Lemma 3.8 we have $X_0 \in \mathfrak{o}_3$. On the other hand, since $X_0 = \sum_{l \geq 1} \alpha_l (\cdot | \xi_l)\xi_l - (\cdot | \xi_{-l})\xi_{-l}$, it follows (see the proof of Lemma 3.8b) that

$$JX_0J^{-1} = \sum_{l \geq 1} \alpha_l (\cdot | J\xi_l)J\xi_l - (\cdot | J\xi_{-l})J\xi_{-l}.$$  

Now, since $J\xi_0J^{-1} = \xi\pm, J\xi_\pm = -\xi\mp$, and $\alpha_{2s-1} = -\alpha_{2s}$ whenever $s = 1, 2, \ldots$, we see that $JX_0J^{-1} = X_0$. Thus $X_0 = gl_\mathbb{H}(H; H) \cap \mathfrak{o}_3 = \mathfrak{o}_3(H)$.

By using the projections onto the subspaces

$$H_s = \text{span} \{\xi_1, \xi_2, \xi_{-s}, \ldots ; \xi_s, \xi_{-s}\}$$

and Corollary 3.13 as in the proof of Proposition 5.2 it then follows that $X_0$ is an Iwasawa quasi-regular element of $\mathfrak{o}_3(H)$ and the corresponding Iwasawa decomposition looks as asserted. It remains to prove that $X_0$ is actually an Iwasawa regular element of $\mathfrak{o}_3(H)$, and this fact can be obtained as in the proof of Proposition 4.7. Specifically, denote $V_s = \mathbb{C}\xi_s$ for $s = 1, 2, \ldots$. Let $X = X^* \in \mathfrak{o}_3$ such that $[X, X_0] = 0$. Since $\alpha_{2s-1} \neq \pm \alpha_{2s}$ whenever $s = 1, 2, \ldots$, we see that $X$ leaves each of the subspaces $V_s$ invariant for $s = 1, 2, \ldots$. Since $X = X^*$, it follows that $X$ has eigenvalues $\gamma_s', \gamma_s'' \in \mathbb{R}$ be the corresponding eigenvalues, so that $Xv_s' = \gamma_s'v_s'$ and $Xv_s'' = \gamma_s''v_s''$. On the other hand the anti-conjugation $J$ satisfies $Jv_s' \subseteq v_s''$ and $Jv_s'' \subseteq v_s'$. When $s \neq t$, hence both $v_s'$ and $v_s''$ have the natural structures of a quaternionic vector space. By counting dimensions, we get $V_s = Jv_s'$ and $V_s'' = Hv_s''$. The operator $X \in gl_\mathbb{H}(H; H)$ is C-linear and $XJ = JX$; hence for every $q \in H$ we have $X(qv_s') = qXv_s' = \gamma_s'qv_s'$, so that $X\xi = \gamma_s'\xi$ whenever $\xi \in V_s'$. Similarly $X\xi = \gamma_s''\xi$ whenever $\xi \in V_s''$. Since $\mathcal{H} = \bigoplus (V_s' \oplus V_s'')$, it then follows that $[X_1, X_2] = 0$ whenever $X_1 = X_2^* \in \mathfrak{o}_3(H)$ and $[X_j, X_0] = 0$ for $j = 1, 2, \ldots$.

To prove the assertion on the global Iwasawa decomposition one can use Proposition 2.16 in a fashion similar to that of the proof of Theorem 4.6. □

6. IWASAWA DECOMPOSITIONS FOR GROUPS OF TYPE C

Just as in Sections 4 and 5 we let $H$ be a complex separable infinite-dimensional Hilbert space, $\Phi$ a mononormalizing symmetric norming function whose Boyd indices are nontrivial, and denote the corresponding separable norm ideal by $\mathfrak{b} = \mathfrak{b}(0) \subseteq B(H)$. As above, we shall use the methods of Section 2 to get global Iwasawa decompositions for classical groups of type C associated with the operator ideal $\mathfrak{b}$.

Complex groups of type C.

Theorem 6.1. Let $J: H \to H$ be an anti-conjugation and $\{\xi_l\}_{l \in \mathbb{Z}\setminus\{0\}}$ be an orthonormal basis in $H$ such that $\xi_{\pm l} = \mp \xi_{\mp l}$ for $l = 1, 2, \ldots$. Now pick a family of
Proof. One can proceed just as in the proof of Proposition 5.1, now using the orthogonal projection $J$ such that 

(6.1) \[ \text{sp}_3 = (u_3 \cap \text{sp}_3) + (a_3.X_0 \cap \text{sp}_3) + (n_3.X_0 \cap \text{sp}_3) \]

(where $u_3$, $a_3.X_0$, and $n_3.X_0$ are the ones defined in Proposition 1.3).

Moreover, there exists a global Iwasawa decomposition $m: K \times A \times N \to \text{Sp}_3$ corresponding to (6.1). In addition we have $AN = NA$, and both groups $A$ and $N$ are simply connected.

Proof. One can proceed just as in the proof of Proposition 5.1 now using the orthogonal projection $\tilde{P}_r: \mathcal{H} \to \mathcal{H}$ onto the subspace

\[ \tilde{\mathcal{H}}_r = \text{span} \{ \xi_1, \xi_{-1}, \xi_2, \xi_{-2}, \ldots, \xi_r, \xi_{-r} \} \]

for $r = 1, 2, \ldots$. We omit the details.

To prove the assertion on the global Iwasawa decomposition one can use Proposition 2.13 in a fashion similar to that of the proof of Theorem 4.6.\hfill\Box

Real groups of type $\text{CI}$.

Theorem 6.2. Let $\tilde{J}: \mathcal{H} \to \mathcal{H}$ be an anti-conjugation and $J: \mathcal{H} \to \mathcal{H}$ a conjugation such that $JJ = \tilde{J}J$. Assume that \{\bar{\xi}_l\}_{l \in \mathbb{Z} \setminus \{0\}} is an orthonormal basis in $\mathcal{H}$ such that $\tilde{J}\xi_{\pm l} = \mp \xi_{\pm l}$ and $\tilde{J}\xi_{\pm l} = \xi_{\pm l}$ for $l = 1, 2, \ldots$. Now pick a family of mutually different real numbers $\{\alpha_l\}_{l \in \mathbb{Z} \setminus \{0\}}$ satisfying the conditions

\[ \alpha_{-l} = -\alpha_l \text{ for all } l \in \mathbb{Z} \setminus \{0\}, \quad \lim_{l \to \infty} \alpha_l = 0, \quad \text{and } \Phi(\alpha_1, \alpha_{-1}, \alpha_2, \alpha_{-2}, \ldots) < \infty, \]

and define the self-adjoint operator

\[ X_0 = \sum_{l \in \mathbb{Z} \setminus \{0\}} \alpha_l (\cdot | \bar{\xi}_l)\bar{\xi}_l \in \mathcal{B}(\mathcal{H}). \]

Then $X_0$ is an Iwasawa regular element of $\text{sp}_3(\mathcal{H}; \mathbb{R})$ and the corresponding Iwasawa decomposition is

(6.2) \[ \text{sp}_3(\mathcal{H}; \mathbb{R}) = (u_3 \cap \text{sp}_3(\mathcal{H}; \mathbb{R})) + (a_3.X_0 \cap \text{sp}_3(\mathcal{H}; \mathbb{R})) + (n_3.X_0 \cap \text{sp}_3(\mathcal{H}; \mathbb{R})) \]

(where $u_3$, $a_3.X_0$, and $n_3.X_0$ are the ones defined in Proposition 1.3).

Moreover, if $G$ stands for the connected $1$-component of $\text{Sp}_3(\mathcal{H}; \mathbb{R})$, then there exists a global Iwasawa decomposition $m: K \times A \times N \to G$ corresponding to (6.3). In addition we have $AN = NA$, and both groups $A$ and $N$ are simply connected.

Proof. The existence of an orthonormal basis as in the statement follows at once by Lemma 3.3.

Let us prove that $X_0 \in \text{sp}_3(\mathcal{H}; \mathbb{R}) = \text{sp}_3 \cap \mathfrak{gl}_3(\mathcal{H}; \mathbb{R})$. In fact $X_0 \in \text{sp}_3$ by Proposition 6.1. On the other hand, for all $l \in \mathbb{Z} \setminus \{0\}$ and $\eta \in \mathcal{H}$ we have

$J((\eta | \bar{\xi}_l)\bar{\xi}_l) = (\bar{\xi}_l | \eta)J\xi_l = (J\eta | \bar{\xi}_l)\bar{\xi}_l = (J\eta | \bar{\xi}_l)\bar{\xi}_l$, whence $JX_0 = X_0J$, and thus $J \in \text{gl}_3(\mathcal{H}; \mathbb{R})$ as well.
Moreover, just as in the proof of Theorem 6.1, it follows that $X_0$ is an Iwasawa quasi-regular element of $\mathfrak{sp}_3(\mathcal{H}; \mathbb{R})$ and the corresponding Iwasawa decomposition looks as asserted. Finally, since $X_0$ is Iwasawa regular in $\mathfrak{sp}_3$ by Theorem 6.1, it follows that it is Iwasawa regular in $\mathfrak{sp}_3(\mathcal{H}; \mathbb{R})$ as well.

To prove the assertion on the global Iwasawa decomposition one can use Proposition 2.15 in a fashion similar to that of the proof of Theorem 4.6.

**Real groups of type CII.**

**Theorem 6.3.** Assume that we have an orthogonal direct sum decomposition $\mathcal{H} = \mathcal{H}_+ \oplus \mathcal{H}_-$ with $\dim \mathcal{H}_+ = \dim \mathcal{H}_-$, and let $\mathcal{J}: \mathcal{H} \to \mathcal{H}$ be an anti-conjugation such that $\mathcal{J}(\mathcal{H}_\pm) \subset \mathcal{H}_\pm$. Also let $V = (\begin{smallmatrix} 0 & 0 \\ 0 & -1 \end{smallmatrix})$ with respect to this orthogonal direct sum decomposition of $\mathcal{H}$. Now let $\lambda l \in \mathbb{Z} \setminus \{0\}$ be an orthonormal basis in $\mathcal{H}$ such that $\mathcal{J}e_{\pm l} = \mp e_{\pm l}$ and $Ve_{\pm l} = \mp ee_{\pm l}$ whenever $e \in \{+, -\}$ and $l = 1, 2, \ldots$. Then define $f_{l}^\pm = (e_l^\pm \pm 0_l^-)/\sqrt{2}$ for all $l \in \mathbb{Z} \setminus \{0\}$. Pick a family of mutually different real numbers $\{\lambda_l\}_{l \in \mathbb{Z} \setminus \{0\}}$ such that

$$
\lambda_- l = -\lambda l \quad \text{whenever} \quad l \in \mathbb{Z} \setminus \{0\}, \quad \lim_{l \to \infty} \lambda_l = 0, \quad \text{and} \quad \Phi(\lambda_1, -\lambda_1, \lambda_2, -\lambda_2, \ldots) < \infty,
$$

and define the self-adjoint operator

$$
X_0 := \sum_{l \in \mathbb{Z} \setminus \{0\}} \lambda l (\cdot, f_{l}^+ f_{l}^+ - (\cdot, f_{l}^- f_{l}^-)).
$$

Then $X_0$ is an Iwasawa regular element of $\mathfrak{sp}_3(\mathcal{H}_+, \mathcal{H}_-)$ and the corresponding Iwasawa decomposition is

$$
\mathfrak{sp}_3(\mathcal{H}_+, \mathcal{H}_-) = (u_3 \cap \mathfrak{sp}_3(\mathcal{H}_+, \mathcal{H}_-)) + (a_3, X_0 \cap \mathfrak{sp}_3(\mathcal{H}_+, \mathcal{H}_-))
$$

$$
(6.3)
$$

(where $u_3$, $a_3, X_0$, and $n_3, X_0$ are the ones defined in Proposition 4.3).

Moreover, if $G$ stands for the connected component of $\text{Sp}_3(\mathcal{H}_+, \mathcal{H}_-)$, then there exists a global Iwasawa decomposition $\mathfrak{m}: K \times A \times N \to G$ corresponding to $\mathcal{H}$. In addition we have $AN = NA$, and both groups $A$ and $N$ are simply connected.

**Proof.** The existence of the orthonormal basis

$$
\bigcup_{l \in \mathbb{Z} \setminus \{0\}} \{e_{l}^+, e_{l}^\mp\}
$$

follows by Lemma 3.15. Just as in the proof of Proposition 4.8 we can see that $X_0 \in u_3(\mathcal{H}_+, \mathcal{H}_-)$. On the other hand, Lemma 3.15(b) shows that $X_0 \in \mathfrak{sp}_3$, and thus $X_0 \in \mathfrak{sp}_3 \cap u_3(\mathcal{H}_+, \mathcal{H}_-) = \mathfrak{sp}_3(\mathcal{H}_+, \mathcal{H}_-)$. Then, by using Corollary 2.13 along with the orthogonal projections on the subspaces

$$
\mathcal{H}_r = \text{span} \left( \bigcup_{-r \leq l \leq r} \{e_{l}^+, e_{l}^\mp\} \right) \text{ for } r = 1, 2, \ldots,
$$

one can prove that $X_0$ is an Iwasawa quasi-regular element of $\mathfrak{sp}_3(\mathcal{H}_+, \mathcal{H}_-)$ and the corresponding Iwasawa decomposition looks as asserted. (See the proof of Proposition 4.8 for more details.)

Now it remains to show that $X_0$ is actually an Iwasawa regular element of $\mathfrak{sp}_3(\mathcal{H}_+, \mathcal{H}_-)$. To this end denote $V_j^0 = \mathbb{C} f_j^+ + \mathbb{C} f_j^-$, $V_j^1 = \mathbb{C} f_j^- + \mathbb{C} f_j^+$, and
\[ \mathcal{V}_j = \mathcal{V}_j^0 \oplus \mathcal{V}_j^1 \] for \( j \geq 1 \). Then let \( X = X^* \in \mathfrak{sp}_2(\mathcal{H}_+, \mathcal{H}_-) \) such that \([X, X_0] = 0\). We have \( \lambda_{-l} = -\lambda_l \) whenever \( l \in \mathbb{Z} \setminus \{0\} \); hence
\[
X_0 := \sum_{j \geq 1} \lambda_j (\langle \cdot | f_j^+ \rangle f_j^+ + \langle \cdot | f_j^- \rangle f_j^-) - \lambda_j (\langle \cdot | f_j^- \rangle f_j^- + \langle \cdot | f_j^+ \rangle f_j^+) .
\]

Since the real numbers \( \{\lambda_j\}_{j \geq 1} \) are mutually different and \([X, X_0] = 0\), it follows that \( X \) leaves both the subspaces \( \mathcal{V}_j^0 \) and \( \mathcal{V}_j^1 \) invariant whenever \( j = 1, 2, \ldots \). Now let us keep \( j \in \{1, 2, \ldots \} \) and \( \varepsilon \in \{0, 1\} \) fixed. Since \( X = X^* \), there exist \( x_0 \in \mathcal{V}_j^\varepsilon \setminus \{0\} \) and \( t_0 \in \mathbb{R} \) such that \( X x_0 = t_0 x_0 \). On the other hand, since \( V \tilde{J} = JV \), it follows directly that \( \tilde{J}_1 := V \tilde{J} \) is an anti-conjugation on \( \mathcal{H} \). In addition, since \( V f_{-j}^\varepsilon = f_{-j}^\varepsilon \) and \( \tilde{J} f_{-j}^\varepsilon = \mp f_{-j}^\varepsilon \), it follows that the linear subspace \( \mathcal{V}_j^\varepsilon \) is invariant under the anti-conjugation \( \tilde{J}_1 \). Let us endow \( \mathcal{V}_j^\varepsilon \) with the corresponding quaternionic structure. Since \( \dim_{\mathbb{C}} \mathcal{V}_j^\varepsilon = 2 \), it follows that \( \dim_{\mathbb{H}} \mathcal{V}_j^\varepsilon = 1 \), and thus \( \mathcal{V}_j^\varepsilon = \mathbb{H} x_0 \). On the other hand \( X = X^* \in \mathfrak{sp}_2(\mathcal{H}_+, \mathcal{H}_-) \); hence \( XV = -VX \) and \( X \tilde{J} = -\tilde{J} X \), whence \( X \tilde{J}_1 = \tilde{J}_1 X \). Thus \( X \) is an \( \mathbb{H} \)-linear operator with respect to the quaternionic structure defined by the anti-conjugation \( \tilde{J}_1 \). Now, since \( \mathcal{V}_j^\varepsilon = \mathbb{H} x_0 \) and \( X x_0 = t_0 x_0 \), it follows that the restriction of \( X \) to \( \mathcal{V}_j^\varepsilon \) is given by the multiplication by the real number \( t_0 \). Since \( \mathcal{H} = \bigoplus_{j \geq 1} (\mathcal{V}_j^0 \oplus \mathcal{V}_j^1) \), it thus follows that the operators in \( \mathfrak{a}_{3, X_0} \cap \mathfrak{sp}_2(\mathcal{H}_+, \mathcal{H}_-) \) commute pairwise, and this completes the proof.

To prove the assertion on the global Iwasawa decomposition one can use Proposition 7.15 in a fashion similar to that of the proof of Theorem 4.6.

7. Decompositions Lifted to Covering Groups

The aim of this short section is to show that the Iwasawa decompositions constructed in Sections 4, 5, and 6 can be lifted to any covering groups. We refer to [Ha72] and [Nee02a] for information on the homotopy groups of the classical Banach-Lie groups associated with the Schatten ideals. It is easy to see that the corresponding description of homotopy groups actually holds true for the classical Banach-Lie groups associated with any separable norm ideal.

**Proposition 7.1.** Let \( G \) be a connected Banach-Lie group, and let \( K, A, \) and \( N \) be connected Banach-Lie subgroups of \( G \) such that the multiplication map

\[ m : K \times A \times N \rightarrow G \]

is a diffeomorphism. In addition, assume that \( A \) and \( N \) are simply connected and \( AN = NA \).

Now assume that we have a connected Banach-Lie group \( \tilde{G} \) with a covering homomorphism \( \tilde{e} : \tilde{G} \rightarrow G \), and define \( \tilde{K} := e^{-1}(K) \), \( \tilde{A} := e^{-1}(A) \), and \( \tilde{N} := e^{-1}(N) \). Then \( \tilde{K}, \tilde{A}, \) and \( \tilde{N} \) are connected Banach-Lie subgroups of \( \tilde{G} \) and the multiplication map \( \tilde{m} : \tilde{K} \times \tilde{A} \times \tilde{N} \rightarrow \tilde{G} \) is a diffeomorphism.

**Proof.** The proof can be achieved by using appropriate infinite-dimensional versions of some standard ideas from the theory of Iwasawa decompositions of reductive groups (specifically, see for instance the proofs of Theorems 6.31 and 6.46 in [Kn96]). We refer to Proposition 4.4 in [Be09] for details.
Corollary 7.2. Let $\mathcal{H}$ be a complex separable infinite-dimensional Hilbert space, \(\Phi\) a mononormalizing symmetric norming function whose Boyd indices are nontrivial, and denote the corresponding separable norm ideal by $I = \mathcal{S}_{\Phi}^{(0)} \subseteq \mathcal{B} (\mathcal{H})$. Then let $m: K \times A \times N \to G$ be the global Iwasawa decomposition given by any of Theorems 4.3, 4.4, 4.5, 5.2, 5.3, 6.1, 6.2, and 6.3 for the connected 1-components of real or complex classical Banach-Lie groups. Now denote by $e: \hat{G} \to G$ any covering group of $G$. If we define $\hat{K} := e^{-1} (K)$, $\hat{A} := e^{-1} (A)$, and $\hat{N} := e^{-1} (N)$, then $\hat{K}$, $\hat{A}$, and $\hat{N}$ are connected Banach-Lie subgroups of $\hat{G}$ and the multiplication map $\hat{m}: \hat{K} \times \hat{A} \times \hat{N} \to \hat{G}$ is a diffeomorphism.

Proof. Use Proposition 7.1. 

APPENDIX A. Auxiliary facts on operator ideals

In this appendix we record some facts on operator ideals, stating them under versions appropriate for use in the main body of the present paper. We refer to [GK70, GL72, El72, EL72, et al.], [Kw02, WC03, DF04, KWW06, Be06, and Be09] for various special topics involving symmetric norm ideals related to the circle of ideas discussed here.

Let $\mathcal{H}$ be a complex Hilbert space and $\mathfrak{P}$ a maximal nest in $\mathcal{B} (\mathcal{H})$. That is, $\mathfrak{P}$ is a maximal linearly ordered set of orthogonal projections on $\mathcal{H}$. Then we denote $\text{Alg} \mathfrak{P} := \{ p \in \mathcal{B} (\mathcal{H}) \mid (\forall p \in \mathfrak{P}) \quad bp = pb \}$ (the nest algebra associated with $\mathfrak{P}$).

In the following statement we need the notion of Boyd indices as used in [Ara78, see also subsections 2.17–2.19 in DF04].

Theorem A.1. Assume that $\mathcal{H}$ is a complex separable Hilbert space and $\mathfrak{P}$ is a maximal nest in $\mathcal{B} (\mathcal{H})$. Let $\Phi$ be a mononormalizing symmetric norming function whose Boyd indices are nontrivial and denote $I = \mathcal{S}_{\Phi}^{(0)}$. Then for every $a \in \text{GL}_2 (\mathcal{H})$ such that $0 \leq a$ there exist uniquely determined operators $d \in \text{GL}_2 (\mathcal{H})$ and $r \in I$ satisfying the following conditions:

- $0 \leq d \in \text{GL}_2 (\mathcal{H}) \cap \text{Alg} \mathfrak{P}$;
- $r \in I \cap \text{Alg} \mathfrak{P}$ and the spectrum of $r$ is equal to $\{0\}$;
- $a = (1 + r^*) d (1 + r)$.

Proof. Theorem 4.1 in [Ara78] and Lemma 4.3 in [El72] show that Theorem 4.2 in [El72] (or Theorem 6.2 in Chapter IV of [GK70]) applies for the operator ideals $\mathcal{S}_1 = \mathcal{S}_{\mathfrak{P}}^{(0)}$. 

Corollary A.2. Let $\mathfrak{P}$, $\Phi$, and $I$ be as in Theorem A.1. Then for every operator $g \in \text{GL}_2 (\mathcal{H})$ there exist $b \in \text{GL}_2 (\mathcal{H}) \cap \text{Alg} \mathfrak{P}$ and $u \in \mathcal{U}_2 (\mathcal{H})$ such that $g = ub$.

Proof. By applying Theorem A.1, for $a = g^* g$ we get the operators $d \in \text{GL}_2 (\mathcal{H})$ and $r \in I$ such that $g^* g = (1 + r^*) d (1 + r)$. Now denote $c = 1 + r \in \text{GL}_2 (\mathcal{H}) \cap \text{Alg} \mathfrak{P}$. Then $g^* g = c^* d c$, $d \geq 0$, and all of the operators $g$, $c$, and $d$ are invertible; hence the operator $u := g (d^{1/2} c)^{-1}$ is unitary. On the other hand, since $0 \leq d \in \text{GL}_2 (\mathcal{H})$, it is straightforward to prove that $d^{1/2} \in \text{GL}_2 (\mathcal{H})$, whence $u \in \mathcal{U}_2 (\mathcal{H})$.

In addition we have $b := d^{1/2} c \in \text{GL}_2 (\mathcal{H}) \cap \text{Alg} \mathfrak{P}$ and $g = ub$, and this completes the proof.

Example A.3. Theorem A.1 and Corollary A.2 apply in particular for the Schatten ideal $I = \mathcal{S}_{\varphi} (\mathcal{H})$ if $1 < p < \infty$.
