ADDITION THEOREMS VIA CONTINUED FRACTIONS

MOURAD E. H. ISMAIL AND JIANG ZENG

Abstract. We show connections between a special type of addition formulas and a theorem of Stieltjes and Rogers. We use different techniques to derive the desirable addition formulas. We apply our approach to derive special addition theorems for Bessel functions and confluent hypergeometric functions. We also derive several addition theorems for basic hypergeometric functions. Applications to the evaluation of Hankel determinants are also given.

1. Introduction

An algebraic addition theorem for a function \( f \) is an identity of the form
\[
P(f(x), f(y), f(x+y)) = 0
\]
for some polynomial \( P \) in three variables. Weierstrass proved that an analytic function satisfying an algebraic addition theorem is a rational function in \( z \), a rational function in \( e^{\lambda z} \) for some \( \lambda \), or an elliptic function, [11, Chapter 13]. This notion is too restricted to be useful in the theory of special functions. In general a family, say \( \phi_{\lambda} \), of special functions satisfies an addition formula if there is an elementary continuous function \( \Lambda \) of three variables \( x, y, t \) and an expansion in terms of a family of special functions \( \psi_\mu \) such that the expansion coefficients factor as products in \( x \) and \( y \). In other words, we have
\[
\phi_{\lambda}(\Lambda(x, y, t)) = \sum_{\mu} C(\lambda, \mu) \phi^\mu_{\lambda}(x) \phi^\mu_{\lambda}(y) \psi_\mu(t), \quad C(\lambda, \mu) \in \mathbb{C}.
\]

Recall the definition of a Bessel function
\[
J_\nu(z) = \sum_{m=0}^{\infty} \frac{(-1)^m}{m! \Gamma(m+\nu+1)} \left( \frac{x}{2} \right)^{2m+\nu} = \frac{(z/2)^\nu}{\Gamma(\nu+1)} {}_0F_1 \left( \begin{array}{c} - \nu + \frac{z^2}{4} \end{array} ; \frac{-1}{4} \right),
\]
and the modified Bessel function
\[
I_\nu(x) := e^{-i\nu\pi/2} J_\nu(e^{i\pi/2} x) = \sum_{m=0}^{\infty} \frac{(x/2)^{\nu+2m}}{m! \Gamma(m+\nu+1)}.
\]

One important addition theorem is the addition theorem for Bessel functions,
\[
\frac{J_\nu(w)}{w^\nu} = \frac{\Gamma(\nu)}{(zZ/2)^\nu} \sum_{n=0}^{\infty} (\nu + n) C_n(\cos \phi) J_{\nu+n}(Z),
\]

for \( \nu \neq 0, -1, -2, \ldots \), where \( w := (z^2 + Z^2 - 2zZ \cos \phi)^{1/2} \), [7] (7.15.30), [26]. The polynomials \( \{C_n^\nu(x)\} \) are the ultraspherical polynomials. The special case \( \phi = \pi \) is

\[
(1.6) \quad \frac{J_\nu(x + y)}{(x + y)^\nu} = \frac{\Gamma(\nu)}{(xy/2)^\nu} \sum_{n=0}^{\infty} \frac{(-1)^n(2\nu)_n}{n!} J_{\nu+n}(x) J_{\nu+n}(y),
\]

since \( C_n^\nu(-1) = (-1)^n(2\nu)_n/n! \). The addition theorems we will encounter in this work are of the type (1.6).

This work arose from an attempt to understand the Stieltjes-Rogers theorem of continued \( J \)-fractions; see Theorem 2.1. It is clear that (2.12) of Theorem 2.1 is an addition theorem of the type (1.6).

We decided to explore \( q \)-analogues of Rogers’ addition formula (2.12) of Theorem 2.1 and to compute the functions \( Q_j(x), j = 0, 1, \ldots \) for specific continued fractions, since the theory of orthogonal polynomials, especially the recently discovered one, provides a rich source of continued \( J \)-fractions. We discovered two \( q \)-analogues of Theorem 2.1. They are Theorems 4.1 and 4.3.

In this work we establish addition theorems for many special functions. To the best of our knowledge only (1.6) and (3.8) are known. We offer three different techniques of proof and provide at least one example of each technique as illustrations.

We realize that it is possible to use fewer techniques to achieve the same goals, but we believe there is merit in utilizing as many different ideas as possible. One approach uses the plane wave expansion, [13] (4.8.2),

\[
(1.7) \quad e^{xy} = \sum_{n=0}^{\infty} \frac{\Gamma(\alpha + \beta + n + 1)}{\Gamma(\alpha + \beta + 2n + 1)} \left(2y\right)^n e^{-y} F_1 \left(\frac{\beta + n + 1}{\alpha + \beta + 2n + 2} \left| 2y \right) P_n^{(\alpha, \beta)}(x),
\]

for \( \alpha > -1, \beta > -1 \), and its special case [13] (4.8.3),

\[
(1.8) \quad e^{xy} = \Gamma(\nu)(y/2)^{-\nu} \sum_{n=0}^{\infty} (\nu + n) I_{\nu+n}(y) C_n^\nu(x), \quad \nu > -1/2.
\]

The polynomials \( \{P_n^{(\alpha, \beta)}(x)\} \) and \( \{C_n^\nu(x)\} \) are Jacobi and ultraspherical polynomials, respectively. The expansions (1.7)–(1.8) are instances of the Fields and Wimp expansions [9]; see also [8], [24]. Other techniques use Rodrigues-type formulas followed by integration by parts, and connection coefficient formulas.

We shall follow the notation and terminology in [1], [15], and [12]. In particular we shall use the Rogers connection coefficients formula for the continuous \( q \)-ultraspherical polynomials \( \{C_n(x; \beta|q)\} \),

\[
(1.9) \quad C_n(x; \gamma|q) = \sum_{k=0}^{[n/2]} \frac{\beta^k(\gamma/\beta)_k\gamma_{n-k}}{q^k(q\beta)_{n-k}} \frac{1 - \beta q^{n-2k}}{1 - \beta} C_{n-2k}(x; \beta|q),
\]

\[
(1.10) \quad U_n(x) = C_n^1(x) = C_n(x; q|q).
\]

2. Preliminaries

Given a moment sequence \( \{\mu_n\} \), we define the linear functional \( \mathcal{L} : x^n \mapsto \mu_n \) on the vector space of polynomials \( \mathbb{C}[x] \). We shall always assume \( \mu_0 = \mathcal{L}(1) = 1 \). Then the monic polynomials \( P_n(x) \) orthogonal with respect to the \( \mathcal{L} \) or the moment
\( \mu_n \) satisfy the following three-term recurrence relation (the spectral theorem for orthogonal polynomials [15, Chapter 2]):

(2.1) \[ P_{n+1}(x) = (x - b_n)P_n(x) - \lambda_n P_{n-1}(x), \quad n \geq 0, \]

where \( \lambda_0 P_1(x) = 0 \) and \( P_0(x) = 1 \). We shall always require the functional to be regular, [5], which is equivalent to demanding that \( \lambda_n \neq 0 \) for all \( n, n > 0 \). The orthogonality relation is

(2.2) \[ \mathcal{L}(P_n) = \lambda_1 \lambda_2 \cdots \lambda_n \delta_{m,n}. \]

The moment sequence is related to the coefficients \( b_n \) and \( \lambda_n \) by the following identity:

(2.3) \[ 1 + \sum_{n=1}^{\infty} \mu_n x^n = \frac{1}{1 - b_0 x - \frac{\lambda_1 x^2}{1 - b_1 x - \frac{\lambda_2 x^2}{1 - b_2 x - \cdots}}}. \]

Define the determinants

\[ \Delta_{i,n} = \begin{vmatrix} \mu_0 & \mu_1 & \cdots & \mu_i \\ \mu_1 & \mu_2 & \cdots & \mu_{i+1} \\ \vdots & \vdots & \ddots & \vdots \\ \mu_{i-1} & \mu_i & \cdots & \mu_{2i-1} \\ \mu_i & \mu_{i+1} & \cdots & \mu_{n+i} \end{vmatrix}, \quad D_n(x) = \begin{vmatrix} \mu_0 & \mu_1 & \cdots & \mu_n \\ \mu_1 & \mu_2 & \cdots & \mu_{n+1} \\ \vdots & \vdots & \ddots & \vdots \\ \mu_{n-1} & \mu_n & \cdots & \mu_{2n-1} \\ 1 & x & \cdots & x^n \end{vmatrix}. \]

In particular, let

(2.4) \[ D_n = \Delta_{n,n}, \quad \chi_n = \Delta_{n,n+1}. \]

Then \( P_n(x) = (D_{n-1})^{-1}D_n(x) \) is the monic orthogonal polynomial sequence for \( \mathcal{L} \).

It is easy to see that

(2.5) \[ \mathcal{L}(x^n P_n(x)) = \frac{D_n}{D_{n-1}} = \lambda_n \lambda_{n-1} \cdots \lambda_1, \]

(2.6) \[ \mathcal{L}(x^{n+1} P_n(x)) = \frac{\chi_n}{D_{n-1}} = \lambda_n \lambda_{n-1} \cdots \lambda_1 (b_0 + \cdots + b_n). \]

Therefore

(2.7) \[ \lambda_n = \frac{\mathcal{L}[P_n^2(x)]}{\mathcal{L}[P_n(x)^2]} = \frac{D_{n-2} D_n}{D_{n-1}^2} \]

and

(2.8) \[ b_n = \frac{\mathcal{L}[x P_n^2(x)]}{\mathcal{L}[P_n(x)^2]} = \frac{\chi_n}{D_n} - \frac{\chi_{n-1}}{D_{n-1}}. \]

The next theorem is the backbone of this work.

**Theorem 2.1.** Define the Stieltjes tableau of entries \( H_{i,n} \) \( (n \geq 0) \) by

\[
H_{i,n} = \begin{cases} 0 & \text{for } i < 0 \text{ and } i > n; \\ 1 & \text{for all } n \geq 0; \\ H_{i,n} = H_{i-1,n-1} + b_i H_{i,n-1} + \lambda_{i+1} H_{i+1,n-1}. 
\end{cases}
\]
Then the generating function \(\sum_{n\geq 0} H_{0,n} x^n\) has the continued fraction expansion \(2.3\) if and only if, for any two nonnegative integers \(k, \ell \geq 0\), the following convolution identities
\[
H_{0,k+\ell} = H_{0,k} H_{0,\ell} + \lambda_1 H_{1,k} H_{1,\ell} + \cdots + \lambda_1 \cdots \lambda_j H_{j,k} H_{j,\ell} + \cdots
\]
hold. Moreover with the exponential generating functions of \(\{Q_j(t)\}\),
\[
Q_j(t) = \sum_{n=j}^{\infty} H_{j,n} \frac{t^n}{n!},
\]
the convolution identity \(2.10\) is equivalent to the addition formula
\[
Q_0(x + y) = \sum_{n=0}^{\infty} \lambda_1 \cdots \lambda_n Q_n(x)Q_n(y).
\]
Wall [23] points out that the first part of Theorem 2.1 is due to Stieltjes, but the addition theorem \(2.12\) is due to Rogers. For a proof and references, see [23, Section 53].

It is important to note that the \(H_{j,n}\)'s are the connection coefficients in
\[
x^n = \sum_{j=0}^{n} H_{j,n} P_j(x).
\]
Observe that the addition formula \(2.12\) is equivalent to
\[
\frac{xh_0(x) - yh_0(y)}{x - y} = \sum_{n=0}^{\infty} \lambda_1 \cdots \lambda_n h_n(x)h_n(y),
\]
where
\[
h_j(t) = \sum_{n=j}^{\infty} H_{j,n} t^n.
\]
Note that if \(x = y\), then \(2.14\) reduces to
\[
xh'_0(x) + h_0(x) = \sum_{n=0}^{\infty} \lambda_1 \cdots \lambda_n h_n(x)^2.
\]
In general \(2.10\) implies
\[
\sum_{m=0}^{\infty} H_{0,m} \sum_{j=0}^{m} c_j s^j d_{m-j} t^{m-j} = \sum_{n=0}^{\infty} \lambda_1 \cdots \lambda_n Q_n(s)R_n(t),
\]
where
\[
Q_n(s) = \sum_{j=n}^{\infty} H_{n,j} c_j s^j, \quad R_n(t) = \sum_{j=n}^{\infty} H_{n,j} d_j t^j.
\]
We may define a generalized translation operator \((GT)\) on polynomials by
\[
(GT)_s x^m = \sum_{j=0}^{m} c_j s^j d_{m-j} t^{m-j}.
\]
One can extend \((GT)\) to formal power series by linearity.
Remark 2.2. According to the Flajolet-Viennot theory \cite{10, 25} we can interpret $H_{i,n}$ in the Stieltjes’ tableau as follows. Let us attach weights to the steps of a lattice path at level $i$ ($i \geq 0$) of a Motzkin path in the following way:

$$w(\uparrow) = 1, \quad w(\downarrow) = b_i \quad \text{and} \quad w(\backslash) = \lambda.$$ 

Let $\Gamma_{0 \rightarrow i}(n)$ be the set of Motzkin paths from level 0 to level $i$ of length $n$. Then we have the following interpretation:

$$H_{i,n} = \sum_{\gamma \in \Gamma_{0 \rightarrow i}(n)} w(\gamma),$$

$$\lambda_1\lambda_2 \cdots \lambda_i H_{i,n} = \sum_{\gamma \in \Gamma_{i \rightarrow 0}(n)} w(\gamma).$$

This provides a combinatorial interpretation of (2.10).

Let $\{P_j(x)\}$ be the monic orthogonal polynomials with respect to the moment sequence $H_{0,n}$ and $\mathcal{L}$ be the functional $\mathcal{L}(x^n) = H_{0,n}$. Then it follows from (2.13) that

\begin{equation}
Q_j(t) = \sum_{n=j}^{\infty} \frac{\mathcal{L}(x^n P_j(x))}{\mathcal{L}(P_j(x))} t^n = \frac{1}{\lambda_1 \cdots \lambda_j} \mathcal{L}(P_j(x)e^{xt}).
\end{equation}

Note that $b_i = H_{i+1,i+2} - H_{i,i+1}$ and

\begin{equation}
H_{j,n} = \frac{\Delta_{j,n}}{\lambda_1 \cdots \lambda_j}.
\end{equation}

Therefore the addition formula (2.12) generalizes the Hankel determinants in (2.4). We refer the readers to \cite{3, 13, 14, 20, 21, 28} for the application of orthogonal polynomials to the computation of Hankel determinants.

The following theorem gives another interpretation of the function $Q_0(x)$ for which our technique will derive an addition theorem.

**Theorem 2.3.** Assume that $\{P_n(x)\}$ are orthogonal with respect to a positive measure $\mu$ with compact support contained in $\{z : |z| < r\}$. Then

\begin{equation}
\lambda_1\lambda_2 \cdots \lambda_j Q_j(t) = \int_{|z|=r} e^{t/z} F_n(1/z) \frac{dz}{z},
\end{equation}

where

\begin{equation}
F_n(z) := \int_{\mathbb{R}} \frac{P_n(u)}{z-u} d\mu(u), \quad z \notin \text{supp}\{\mu\}.
\end{equation}

**Proof.** Let $\mu_n = \int_{\mathbb{R}} x^n d\mu(x)$. The right-hand side of (2.20) is

$$\int_{|z|=r} e^{t/z} \int_{\mathbb{R}} \frac{P_n(u)}{1-zu} d\mu(u) \frac{dz}{z} = \int_{|z|=r} \int_{\mathbb{R}} \sum_{n=0}^{\infty} \frac{t^n z^{-n}}{n!} \sum_{k=0}^{\infty} (uz)^k P_j(u) d\mu(u) \frac{dz}{z}$$

$$= \int_{\mathbb{R}} \sum_{n=0}^{\infty} \frac{(tu)^n}{n!} P_j(u) d\mu(u) = \int_{\mathbb{R}} e^{tu} P_j(u) d\mu(u),$$

and the theorem follows from (2.18). \qed
The function $F_n(z)$ is related to the function of the second kind \[15\].

Throughout this work we will use the Heine transformation
\begin{equation}
2\phi_1(A, B, C, Z) = \frac{(B, AZ; q)_\infty}{(C, Z; q)_\infty} 2\phi_1(C/B, Z; AZ; q, B)
\end{equation}
(see \[12\] (III.1)) and the $2\phi_1$ to $2\phi_2$ transformation
\begin{equation}
2\phi_1(A, B; C; q, Z) = \frac{(AZ; q)_\infty}{(Z; q)_\infty} 2\phi_2(A, C/B; C, AZ; q, BZ).
\end{equation}
See \[12\] (III.4)].

3. Ultraspherical and Jacobi Polynomials

The ultraspherical (or Gegenbauer) polynomials are
\begin{equation}
C_n^\nu(x) = \frac{(2\nu)_n}{n!} \, _2F_1\left( -n, \frac{n + 2\nu}{\nu} \left| \frac{1 - x}{2} \right. \right), \quad \nu \neq 0.
\end{equation}
The normalized weight function is
\begin{equation}
w(x) = (1 - x^2)^{\nu - 1/2} A(\nu), \quad A(\nu) = \frac{\Gamma(\nu + 1)}{\Gamma(1/2)\Gamma(\nu + 1/2)}.
\end{equation}
The corresponding orthogonality functional $\mathcal{L}$ is defined by
\begin{equation}
\mathcal{L}(f) = \int_{-1}^{1} f(x)w(x)dx.
\end{equation}
The monic ultraspherical polynomials $\{P_n(x)\}$ and the $\lambda_j$ are
\begin{equation}
P_n(x) = \frac{n!}{(\nu)_n} 2^{-n} C_n^\nu(x), \quad \lambda_j = \frac{j(j + 2\nu - 1)}{4(\nu + j - 1)(\nu + j)}.
\end{equation}
Moreover
\begin{equation}
xP_n(x) = P_{n+1}(x) + \frac{n(n + 2\nu - 1)}{4(\nu + n - 1)(\nu + n)} P_{n-1}(x).
\end{equation}
Therefore \textbf{(2.18)} when $\nu > -1/2$ implies
\begin{equation}
Q_i(x) = \frac{1}{\lambda_1 \lambda_2 \ldots \lambda_i} \mathcal{L} \left( e^{x} P_i(x) \right)
= \frac{1}{\lambda_1 \lambda_2 \ldots \lambda_i} \Gamma(\nu)(t/2)^{-\nu} \mathcal{L} \left( \sum_{n=0}^{\infty} (\nu + n) I_{\nu+n}(t) C_n^\nu(x) P_i(x) \right)
= \Gamma(\nu)(t/2)^{-\nu} \frac{2^i (\nu)_i}{i!} (\nu + i) I_{\nu+i}(t).
\end{equation}
Therefore
\begin{equation}
Q_i(t) = \frac{2^i \Gamma(\nu + i + 1)}{i!(t/2)^\nu} I_{\nu+i}(t).
\end{equation}
It is straightforward to see that addition formula \textbf{(2.12)} in the present example is equivalent to \textbf{(1.7)}.

Next we consider Jacobi polynomials. The normalized weight function is
\begin{equation}
w(x) = (1 - x)^{\alpha}(1 + x)^{\beta} A(\alpha, \beta), \quad A(\alpha, \beta) = \frac{\Gamma(\alpha + \beta + 2)}{2^{\alpha+\beta+1}\Gamma(\alpha+1)\Gamma(\beta+1)}.
\end{equation}
In this case, the functional $\mathcal{L}$ to be considered is
\[
\mathcal{L}(f) = \int_{-1}^{1} f(x)w(x)dx.
\]
The monic Jacobi polynomials $\{P_n(x)\}$ are defined through
\[
P_n^{(\alpha,\beta)}(x) = \frac{(n + \alpha + \beta + 1)n}{2^n n!} P_n(x),
\]
so that
\[
\lambda_n = \frac{4n(n + \alpha)(n + \beta)(n + \alpha + \beta)}{(2n + \alpha + \beta - 1)(2n + \alpha + \beta)^2(2n + \alpha + \beta + 1)}.
\]

As in the case of ultraspherical polynomials we can use (1.7) and the result is
\[
(3.3)
\]
\[
Q_{i}(x) = \frac{t^i e^{-t}}{i!} \binom{i}{\beta + i + 1} \binom{\alpha + \beta + 2i + 2}{2i} F_1\left(\frac{\beta + i + 1}{\alpha + \beta + 2i + 2}, 2t\right).
\]

As an example of the use of the Rodrigues formulas we give another derivation of (3.4). The Rodrigues formula for Jacobi polynomials is \[15\] (4.2.8)
\[
(3.5)
\]
\[
(1-x)^{\alpha}(1+x)^{\beta} P_n^{(\alpha,\beta)}(x) = \frac{(-1)^n}{2^n \, n!} \frac{d^n}{dx^n} \left[(1-x)^{\alpha + 1} (1+x)^{\beta + 1}\right].
\]

Therefore
\[
Q_j(t) = \frac{2^j j! A(\alpha,\beta)}{\lambda_1 \ldots \lambda_j (\alpha + \beta + j + 1)} \int_{-1}^{1} e^{xt} (1-x)^{\alpha} (1+x)^{\beta} P_j^{(\alpha,\beta)}(x) \, dx
\]
\[
= \frac{(-1)^j A(\alpha,\beta)}{\lambda_1 \ldots \lambda_j (\alpha + \beta + j + 1)} \int_{-1}^{1} e^{xt} \frac{d^j}{dx^j} \left[(1-x)^{\alpha + 1} (1+x)^{\beta + 1}\right] \, dx
\]
\[
= \frac{t^j A(\alpha,\beta)}{\lambda_1 \ldots \lambda_j (\alpha + \beta + j + 1)} \int_{-1}^{1} e^{xt} (1-x)^{\alpha + 1} (1+x)^{\beta + j} \, dx,
\]

after integration by parts. Taking into account the integral representation [6] 6.5.1)]
\[
(3.6)
\]
\[
\int_{-1}^{1} e^{z u} u^{a-1} (1-u)^{c-a-1} \, du, \quad \text{Re} \, c > \text{Re} \, a > 0,
\]

\[
(3.7)
\]
\[
Q_j(t) = \frac{t^j}{j!} e^{\frac{x}{2}} 1_F\left(\frac{\alpha + j + 1}{\alpha + \beta + 2j + 2}; -2t\right).
\]

The equivalence of the representations (3.4) and (3.7) follows from the transformation [15] (1.4.11)]
\[
_{1}F_{1}\left(\frac{a}{c}; z\right) = e^{\frac{z}{2}} 1_F\left(\frac{c - a}{c}; -z\right).
\]

This analysis establishes the following theorem, which is the main result of this section.
Theorem 3.1. We have the addition theorem for the confluent hypergeometric functions

\[
{\textstyle 1F_1}\left(\frac{\alpha + 1}{\alpha + \beta + 2} \mid t + s\right) = \sum_{n=0}^{\infty} \frac{(\alpha + 1)_n (\beta + 1)_n (\alpha + \beta + 1)_n}{(\alpha + \beta + 1)_{2n} (\alpha + \beta + 2)_{2n}} \frac{(ts)^n}{n!}
\]

\[
\times {\textstyle 1F_1}\left(\frac{\alpha + n + 1}{\alpha + \beta + 2n + 2} \mid t\right) {\textstyle 1F_1}\left(\frac{\alpha + n + 1}{\alpha + \beta + 2n + 2} \mid s\right).
\]

When \(\alpha = \beta = \nu - 1/2\), Theorem 3.1 reduces to (1.6) since

\[
(3.8)
\]

\[
e^{-x} \textstyle 1F_1(\nu + 1/2; 2\nu + 1; 2x) = \Gamma(\nu + 1)(2/x)^\nu I_\nu(x),
\]

(3.9) [6, (6.9.10)]. Moreover both (3.4) and (3.7) also reduce to (3.1).

Note that Theorem 3.1 and (3.1) can be proved from Theorem 2.3 and the facts

\[
\int_{-1}^{1} (1-t)^\alpha (1+t)^\beta \textstyle 2F_1\left(\frac{\alpha+\beta}{2}; \frac{2n+\alpha+\beta+1}{2} \mid \frac{z}{1-z}\right) dt = \frac{\Gamma(n+\alpha+1)\Gamma(n+\beta+1)}{\Gamma(2n+\alpha+\beta+2)} \times \frac{2^{n+\alpha+\beta+1}}{(z-1)^{n+1}} 2F_1\left(n+1, \frac{\alpha+1}{\alpha+\beta+2n+2} \mid \frac{2}{1-z}\right);
\]

see (4.4.1) and (4.4.6) in [15]. Moreover the integral

\[
\int_{-1}^{1} e^{xt} (1-x)^\alpha (1+x)^\beta \textstyle 2F_1\left(\frac{\alpha+\beta}{2}; \frac{2n+\alpha+\beta+1}{2} \mid \frac{z}{1-z}\right) dx
\]

can be evaluated from the plane wave expansion (1.7) instead of the use of Rodrigues’ formula.

It must be noted that (3.8) coincides with formula (42) of Burchnall and Chaundy [4]. It is also a limiting case of formula (50) [4]. The latter is stated in [15]; see the first unnumbered formula after (7) in Section 2.5.2. Indeed if we replace \(z\) by \(z/b\) and \(\zeta\) by \(\zeta/b\) and let \(b \to \infty\), the above-mentioned formula reduces to our (3.8). The terminating case \(\alpha = -m - 1, \beta = \gamma + m\) of (3.8) is the case \(r = 0\) of Koornwinder’s addition formula for Laguerre polynomials; see (3.3) in [19]. Also, this terminating case of (3.8) is the inverse of 10.12(42) in [7].

4. Two \(q\)-addition formulas

The \(q\)-binomial formula

\[
(4.1)
\]

\[
\sum_{n=0}^{\infty} \frac{(a; q)_n t^n}{(q; q)_n} = \frac{(at; q)_\infty}{(t; q)_\infty}
\]

yields Euler’s \(q\)-analogues of the exponential formulas:

\[
(4.2)
\]

\[
\sum_{n=0}^{\infty} \frac{t^n}{(q; q)_n} = \frac{1}{(t; q)_\infty},
\]

\[
(4.3)
\]

\[
\sum_{n=0}^{\infty} \frac{q^n (z)_n t^n}{(q; q)_n} = (-t; q)_\infty.
\]

The \(q\)-difference operator is defined by

\[
D_q f(z) = \frac{f(z) - f(qz)}{(1 - q)z}.
\]
It is easy to see that

\[ \mathcal{D}_q^{i/2}((-x^2; q)_{\infty}) = \frac{t^{i/2}}{(1-q)^{i/2}}(-xt^2; q)_{\infty}, \]

\[ \mathcal{D}_q^{i} \left( \frac{1}{(xt; q)_{\infty}} \right) = \frac{t^i(1-q)^{-i}}{(xt; q)_{\infty}}. \]

Note also that

\[ \mathcal{D}_q^{i/2} \left( \frac{1}{(xt; q)_{\infty}} \right) = \frac{t^{i/2}}{(1-q)^{i/2}} \frac{1}{(xt^{-1}; q)_{\infty}}, \]

\[ \mathcal{D}_q^{i} \left( (-x^2; q)_{\infty} \right) = \frac{t^i}{(1-q)^i}(-xt^2; q)_{\infty}. \]

4.1. First \( q \)-addition formula. Define the \( q \)-translation operator \( T_{y,q} \) by

\[ T_{y,q}x^n = (x+y)(x+yq)\cdots(x+yq^{n-1}). \]

Extend this by linearity on functions \( f(x) = \sum_{n=0}^{\infty} a_n x^n \), so that

\[ T_{y,q}f(x) = \sum_{n=0}^{\infty} a_n (x+y)(x+yq)\cdots(x+yq^{n-1}). \]

Note that

\[ T_{y,q^{-1}}x^n = (x+y)(x+y/q)\cdots(x+y/q^{n-1}) = T_{x,q}y^n q^{-\binom{n}{2}}. \]

Define two \( q \)-analogues of \( Q_j(t) \) by

\[ Q_j(t; q) = \sum_{n=0}^{\infty} H_{n,k}(q^{(2)n}) \frac{t^n}{(q; q)_n}, \quad \bar{Q}_j(t; q) = \sum_{n=0}^{\infty} H_{n,k}(q^{(2)n}) q^n. \]

**Theorem 4.1.** The convolution identity (4.10) is equivalent to the addition formula

\[ T_{y,q}Q_0(t; q) = \sum_{n=0}^{\infty} \lambda_1 \cdots \lambda_n Q_n(t; q) \bar{Q}_n(s; q). \]

Moreover, we have

\[ Q_j(t; q) = \frac{1}{\lambda_1 \cdots \lambda_j} \mathcal{L} \left( \frac{P_j(x)}{(xt; q)_{\infty}} \right), \]

\[ \bar{Q}_j(t; q) = \frac{1}{\lambda_1 \cdots \lambda_j} \mathcal{L} \left( P_j(x)(-xt; q)_{\infty} \right). \]

**Proof.** The \( q \)-binomial theorem and the definition of \( T_y \) give

\[ T_{y,q}x^n = (x+y)(x+yq)\cdots(x+yq^{n-1}) = \sum_{k=0}^{n} \binom{n}{k} q^{(2)}_{x}[x^{n-k}y^k]. \]

This establishes the equivalence of (4.11) and (4.10). Equations (4.12) and (4.13) follow from Euler’s formulas (4.12)–(4.3).
4.2. Little Jacobi polynomials. The little $q$-Jacobi polynomials $\{p_n(x; a, b)\}$ are defined by

\begin{equation}
P_n(x; a, b) = 2\phi_1(q^{-n}, abq^{n+1}; aq; qx).
\end{equation}

See [18, pp. 92-93]. The corresponding monic polynomials $\{P_n(x)\}$ are given by

\begin{equation}
P_n(x; a, b) = (-1)^nq^{-\frac{n(n-1)}{2}}(abq^{n+1}; aq)_n P_n(x)
\end{equation}

and

\begin{equation}
\lambda_n = \frac{aq^{2n-1}(1-q^n)(1-aq^n)(1-bq^n)(1-abq^n)}{(1-abq^{2n})(1-abq^{2n+1})(1-abq^{2n+1})}.
\end{equation}

Let

\begin{equation}
a = q^\alpha, \quad b = q^\beta.
\end{equation}

Then the weight function is given by

\begin{equation}
w(x; \alpha, \beta) = \frac{(qx; q)_\infty}{(q^{2\alpha+1}; q)_\infty} x^\alpha,
\end{equation}

and the corresponding orthogonality functional is

\begin{equation}
\mathcal{L}(f) = \frac{(aq, bq; q)_\infty}{(abq^{2n}; q)_\infty(x-q^n)(1-q)} \int_0^1 f(x)w(x; \alpha, \beta) d_q x,
\end{equation}

where the $q$-integral is defined (see [12, p.23]) by

\begin{equation}
\int_0^a f(t) d_q t := a(1-q) \sum_{n=0}^\infty f(q^n a) q^n a
\end{equation}

and

\begin{equation}
\int_a^b f(t) d_q t = \int_0^b f(t) d_q t - \int_0^a f(t) d_q t.
\end{equation}

The Rodrigues-type formula for the little $q$-Jacobi polynomials is

\begin{equation}
P_j(x; a, b) = \frac{1}{w(x; \alpha, \beta)} \frac{(1-q)^j q^{2j+1}(x)}{(q^{2\alpha+1}; q)_j} D^j_{1/q}(w(x; \alpha + j, \beta + j)).
\end{equation}

Therefore

\begin{equation}
Q_j(t; q)
= \frac{a^{-j}q^{-j^2} (abq^2; q)_{2j} (aq, bq; q)_\infty}{(q, abq, abq; q)_{2j} (aq^2, bq^2; q)_\infty (1-q)} \int_0^1 (-x; q)_\infty w(x; \alpha, \beta) P_j(x) d_q x
\end{equation}

\begin{equation}
= \frac{a^{-j}q^{-j^2} (abq^2; q)_{2j} (aq, bq; q)_\infty}{(q, abq, abq; q)_{2j} (abq^2, q; q)_\infty (1-q)} \int_0^1 (-x; q)_\infty w(x; \alpha, \beta) P_j(x; a, b) d_q x
\end{equation}

\begin{equation}
= \frac{q^{-j} (abq^2; q)_{2j} (aq, bq; q)_\infty}{(q, abq, abq; q)_{2j} (abq^2, q; q)_\infty (1-q)} \int_0^1 (-x; q)_\infty D^j_{1/q}(w(x; \alpha + j, \beta + j)) d_q x.
\end{equation}

The $q$-analogue of integration by parts is

\begin{equation}
\int_a^b D_q(f(x)) w(x) d_q x = -\frac{1}{q} \int_a^b f(x) D_{1/q}(w(x)) d_q x,
\end{equation}

License or copyright restrictions may apply to redistribution; see http://www.ams.org/journal-terms-of-use
provided that $w(a/q) = w(b/q) = 0$; see [10, (11.4.9)]. Applying (4.20) to the last expression for $Q_j(t; q)$ we obtain
\[
Q_j(t; q) = \frac{(abq^2; q)_j (aq, bq; q)_\infty t^j (q; q)_\infty}{(aq, bq; q)_j (abq^2; q)_\infty} \sum_{n=0}^{\infty} \frac{(-tq^{j+n}, q^{n+1}; q)_\infty}{(q^{j+n+1}; q)_\infty} q^{(\alpha+j+1)n}
\]
\[
= \frac{(-tq^j, aq^{j+1}; q)_\infty t^j q^{(j)}}{(q; q)_j (abq^{2j}; q)_\infty} 2\phi_1 \left( \begin{array}{c} bq^{j+1}, 0 \\ -tq^j \end{array} \right| q, aq^{j+1} \right).
\]
This shows that
\[
(4.21) \quad Q_j(t; q) = \frac{t^j q^{(j)}}{(q; q)_j} \lim_{\epsilon \to 0} \frac{(-tq^j, aq^{j+1}; q)_\infty}{(abq^{2j+2}; q)_\infty} 2\phi_1 \left( \begin{array}{c} bq^{j+1}, \epsilon \\ -tq^j \end{array} \right| q, aq^{j+1} \right).
\]
Now the Heine transformation (4.22) leads to
\[
\frac{(-tq^j, aq^{j+1}; q)_\infty}{(abq^{2j+2}; q)_\infty} 2\phi_1 \left( \begin{array}{c} bq^{j+1}, \epsilon \\ -tq^j \end{array} \right| q, aq^{j+1} \right) = 2\phi_1 \left( \begin{array}{c} -tq^j/\epsilon, aq^{j+1} \\ abq^{2j+2} \end{array} \right| q, \epsilon \right).
\]
Therefore the above equation and (4.21) establish the basic hypergeometric representation
\[
(4.22) \quad Q_j(t; q) = \frac{t^j q^{(j)}}{(q; q)_j} 1\phi_1 \left( \begin{array}{c} aq^{j+1} \\ abq^{2j+2} \end{array} \right| q, -tq^j \right).
\]
Similarly we have
\[
Q_j(t; q) = \frac{(abq^2; q)_j (aq, bq; q)_\infty t^j (q; q)_\infty}{(aq, bq; q)_j (abq^2; q)_\infty} \sum_{n=0}^{\infty} \frac{(1^n+n; q)_\infty a^n q^{(j+1)n}}{(q^{n+1}; q)_\infty} q^{(\alpha+n+1)n}
\]
\[
= \frac{t^j (aq^{j+1}; q)_\infty}{(q; q)_j (t, abq^{2j+2}; q)_\infty} 2\phi_1 \left( \begin{array}{c} bq^{j+1}, t \\ 0 \end{array} \right| q, aq^{j+1} \right).
\]
Applying the Heine transformation (4.23) to the last $2\phi_1$ yields
\[
(4.23) \quad Q_j(t; q) = \frac{t^j (q; q)_j}{(q; q)_j} 2\phi_1 \left( \begin{array}{c} 0, aq^{j+1} \\ abq^{2j+2} \end{array} \right| q, t \right).
\]

**Theorem 4.2.** For the functional in (4.18) the functions $Q_j(t; q)$ and $Q_j(t; q)$ are given by (4.22) and (4.23). Moreover we have the following addition formula:
\[
2\phi_1 \left( \begin{array}{c} aq, -s/t \\ abq \end{array} \right| q, t \right) = \sum_{j=0}^{\infty} \frac{q^{(j)} (aq, bq; q)_j (aq, abq; q)_j}{(q; q)_j (aq, abq^2; q)_j} (qast)^j
\]
\[
\times 2\phi_1 \left( \begin{array}{c} 0, aq^{j+1} \\ abq^{2j+2} \end{array} \right| q, t \right) 1\phi_1 \left( \begin{array}{c} aq^{j+1} \\ abq^{2j+2} \end{array} \right| q, -sqt \right).
\]

**Proof.** We only need to show that the left-hand side of (4.24) is $T_{s,t} Q_0(t, q)$. This is indeed the case as can be seen from (4.18). \[\square\]

It is important to note that Theorem 4.2 is a $q$-analogue of Theorem 3.1. Indeed with $a = q^a, b = q^b$ and $s$ and $t$ replaced by $s(1 - q)$ and $t(1 - q)$, respectively, equation (4.24) tends to (3.8) as $q \to 1^-$. Note that the transformation (2.23) implies
\[
Q_j(t; q) = \frac{t^j}{(q; q)_j (t; q)_\infty} 1\phi_1 \left( \begin{array}{c} bq^{j+1} \\ abq^{2j+2} \end{array} \right| q, aq^{j+1} at \right).
Thus the addition theorem \((4.24)\) has the alternate form
\[
2\phi_1 \left( \frac{aq}{abq^2}, \frac{-s/t}{abq^2}; q, t \right) = \sum_{j=0}^{\infty} \frac{q^j (q)_j (aq, bq, abq; q)_j}{(q)_j (aq, abq^2; q)_j} (qast)^j \left( \frac{aq^{j+1}}{abq^{2j+2}}, \frac{aq^{j+1}}{abq^{2j+2}} \right) \left( q, q^{j+1}at \right) \left( \frac{aq^{j+1}}{abq^{2j+2}}, qJ \right).
\]
(4.26)

**Remark.** A different \(q\)-analogue of Theorem 3.1 was given by Jackson [17, (55)].

### 4.3. Big \(q\)-Jacobi Polynomials

The monic big \(q\)-Jacobi polynomials are
\[
p_n(x; a, b, c) = \frac{(abq^{n+1}; q)_n}{(aq, cq; q)_n} P_n(x).
\]
(4.27)

Let
\[
w_1(x, a, b, c) = \frac{(x/a, x/c)_\infty}{(x, bx/c)_\infty}
\]
and
\[
w(x, a, b, c) = \frac{w_1(x, a, b, c)}{aq(1-q)} \frac{(aq, bq, cq, abq/c; q)_\infty}{(q, abq^2, c/a, aq/c; q)_\infty}
\]
(4.29)

The corresponding orthogonality functional is
\[
\mathcal{L}(f) = \int_{cg}^aq f(x)w(x, a, b, c)d_qx.
\]
(4.30)

The Rodrigues-type formula for big \(q\)-Jacobi polynomials is
\[
w_1(x)p_n(x; a, b, c) = \frac{a^n c^n q^{n(n+1)}(1-q)^n}{(aq, cq; q)_n} D_q^n w_1(x, aq^n, bq^n, cq^n).
\]
(4.31)

Note that
\[
\lambda_n = \frac{-acq^{n+1}(1-q^n)(1-aq^n)(1-bq^n)(1-cq^n)(1-abq^n)(1-abq^{n+1})}{(1-abq^{2n-1})(1-abq^{2n})(1-abq^{2n+1})}.
\]
(4.32)

So
\[
\lambda_1 \cdots \lambda_j = \frac{(-ac)^j q^{j(j+3)/2}(aq, bq, cq, abq/c; q)_j}{(aq, abq^2; q)_2j}.
\]
(4.33)

Therefore
\[
Q_j(t, a, b, c) = \frac{1}{\lambda_1 \cdots \lambda_j} \mathcal{L}(P_j(x)/(xt; q)_\infty)
\]
\[
= \frac{(-1)^j (1-q)^j q^{j(j+1)}(aq^{j+1}, bq^{j+1}, cq^{j+1}, abq^{j+1}; c; q)_\infty}{(q; q)_j aq(1-q)(q, abq^2, c/a, aq/c; q)_\infty}
\]
\[
\times \int_{cq}^aq D_q^j w_1(x, aq^j, bq^j, cq^j) dx
\]
\[
= t^j q^{-j} (abq^2; q)_2j (aq^{j+1}, bq^{j+1}, cq^{j+1}, abq^{j+1}; c; q)_\infty \quad I_j,
\]
(4.34)
where

\[ I_j = \frac{1}{q(1-q)} \int_{c_{aq}}^{aq} (xq^{-j}/a, xq^{-j}/c; q)_\infty d_q x \]

\[ = a \sum_{n=0}^{\infty} (q^{n+1}, aq^{n+1}/c; q)_\infty (qtq^{n+1}/a; q)_\infty \]

\[ - c \sum_{n=0}^{\infty} (q^{n+1}, eq^{n+1}/a; q)_\infty (ctq^{n+1}/a; q)_\infty \]

\[ = \frac{aq^j (aq/c, q; q)_\infty}{(aq^{j+1}, abq^{j+1}/c, atq; q)_\infty} \phi_2 \left( \begin{array}{cc} aq^{j+1}, abq^{j+1}/c, & atq \\ aq/c, & 0 \end{array} \bigg| q, q \right) \]

\[ - \frac{cq^j (cq/a, q; q)_\infty}{(cq^{j+1}, bq^{j+1}, ctq; q)_\infty} \phi_2 \left( \begin{array}{cc} cq^{j+1}, bq^{j+1}, & ctq \\ cq/a, & 0 \end{array} \bigg| q, q \right). \]

The conclusion of the above calculations is that

\[ Q_j(t, a, b, c) = \frac{t^j}{(q; q)_j (aq^{2j+2}, q)_\infty} \]

\[ \times \left[ \frac{(bq^{j+1}, cq^{j+1}; q)_\infty}{(c/a, atq; q)_\infty} \phi_2 \left( \begin{array}{cc} aq^{j+1}, abq^{j+1}/c, & atq \\ aq/c, & 0 \end{array} \bigg| q, q \right) \right. \]

\[ + \left. \frac{(aq^{j+1}, abq^{j+1}/c; q)_\infty}{(a/c, ctq; q)_\infty} \phi_2 \left( \begin{array}{cc} cq^{j+1}, bq^{j+1}, & ctq \\ cq/a, & 0 \end{array} \bigg| q, q \right) \right]. \]

Next we apply (12.5.8) in [15] with \( A = D/(qtq), B = aq^{j+1}, C = abq^{j+1}/c, E = abq^{2j+2} \) and let \( D \to 0 \) and realize that \( Q_j(t, a, b, c) \) has the representation

\[ Q_j(t, a, b, c) = \frac{t^j}{(q; q)_j (aq^{2j+2}, q)_\infty} \phi_1 \left( \begin{array}{cc} aq^{j+1}, abq^{j+1}/c, & \]
Theorem 4.3. The functions $Q_j(t, a, b, c)$ and $\tilde{Q}_j(t, a, b, c)$ associated with the big $q$-Jacobi functional (4.10) are defined in (4.35) and (4.38) (or in (4.37)). Moreover we have the following addition formula:

\[
\frac{(-qas; q)_\infty}{(-s; q)_\infty} \, 3\phi_2 \left( \begin{array}{c} qa, \ \qab^2, \ -qas \ \\ abq/c, \ -s/t \end{array} \right) | q, qct \right.
\]

(4.39) \]

\[
\times \, 2\phi_1 \left( \begin{array}{c} aqj+1, \ \qab^{j+1/c} \ \\ abq^{2j+2} \end{array} \right) | q, qct \right)
\]

(4.39) \]

\[
\times \, 2\phi_1 \left( \begin{array}{c} aqj+1, \ \qab^{j+1/c} \ \\ abq^{2j+2} \end{array} \right) | q, -s \right).
\]
Proof. We only need to evaluate $T_{s_0}Q_0(t; a, b, c)$. Clearly $T_{s_0}Q_0(t; a, b, c)$ is

$$
\sum_{n=0}^{\infty} \frac{(qa, qab/c; q)_n}{(q, abq^2; q)_n} (q)e_n \sum_{k=0}^{\infty} \frac{(qa)^k}{(q; q)_k} t^{n+k}
$$

$$
= \sum_{n=0}^{\infty} \frac{(qa, qab/c; q)_n}{(q, abq^2; q)_n} (q)e_n \sum_{k=0}^{\infty} \frac{(qa)^k}{(q; q)_k} t^{n+k} (-s/t; q)_{n+k}
$$

$$
= \sum_{n=0}^{\infty} \frac{(qa, qab/c - s/t; q)_n}{(q, abq^2; q)_n} (qct)_n \phi_0 (-q^n s/t; --; q, qat)
$$

$$
= \sum_{n=0}^{\infty} \frac{(qa, qab/c - s/t; q)_n}{(q, abq^2; q)_n} (qct)_n \phi_0 (-q^{n+1} as; q)_{\infty}
$$

The $q$-binomial theorem reduces the last expression to

$$
\frac{(-qas; q)_{\infty}}{(qat; q)_{\infty}} \phi_2 \left( \begin{array}{cc} qa, qab/c, -s/t \\ abq^2, -qas \\ q, qct \end{array} \right),
$$

and the theorem follows.

4.4. Second $q$-addition formula. Define the noncommutative operation $S_y$ on $f(x) = \sum_{n=0}^{\infty} a_n x^n$ by

$$
S_y f(x) = \sum_{n=0}^{\infty} a_n (x + y)^n,
$$

where $yx = qxy$. Recall [12, p.28] that the noncommutative binomial theorem reads

$$
(x + y)^n = \sum_{k=0}^{n} \binom{n}{k} x^k y^{n-k}.
$$

Theorem 4.4. The convolution identity (2.40) is equivalent to the noncommutative addition formula

$$
S_y Q_0(t; q) = \sum_{n=0}^{\infty} \lambda_1 \cdots \lambda_n Q_n(t; q) Q_n(s; q).
$$

Moreover, we have

$$
Q_j(t; q) = \frac{1}{\lambda_1 \cdots \lambda_j} \mathcal{L} \left( \frac{P_j(x)}{(xt; q)_{\infty}} \right).
$$

Proof. The noncommutative binomial theorem and the definition of $S_y$ give

$$
S_y x^n = \sum_{k=0}^{n} \binom{n}{k} y^n x^k.
$$

Multiplying (2.10) by $t^m s^n / (q; q)_m (q; q)_n$ and summing over all $m, n \geq 0$, we get

$$
\sum_{m, n \geq 0} H_{0, m+n} t^m s^n (q; q)_m (q; q)_n = \sum_{j, m, n \geq 0} t^{m+n} H_j H_{j, n} \lambda_1 \cdots \lambda_j.
$$

This establishes the equivalence of (4.41) and (2.10). Equation (4.42) follows from Euler’s formula.
Example. We consider the Rogers-Szegő polynomials, which are defined by

\[ h_n(a; q) = \sum_{k=0}^{n} \binom{n}{k}_q a^k. \]  

(4.43)

They have the q-exponential generating function

\[ Q_0(t; q) = \sum_{n=0}^{\infty} \frac{h_n(a; q)}{(q; q)_n} t^n = \frac{1}{(t; q)_\infty (at; q)_\infty}. \]

Therefore

\[ S_s Q_0(t; q) = \sum_{n=0}^{\infty} \frac{h_n(a; q)}{(q; q)_n} (t+s)^n \]

\[ = \frac{1}{(t+s; q)_\infty (a(t+s); q)_\infty}. \]

The corresponding orthogonal polynomials are Al-Salam-Carlitz polynomials \( U_n^{(a)}(x; q) \), which have the generating function

\[ \frac{(t, at; q)_\infty}{(xt; q)_\infty} = \sum_{n=0}^{\infty} \frac{U_n^{(a)}(x; q)}{(q; q)_n} t^n. \]  

(4.44)

The associated functional is defined by

\[ \mathcal{L} f(x) = \frac{1}{(1-q)(q, a, q/a; a)_\infty} \int_a^1 (q x, qx/a; q)_\infty f(x) d_q x. \]

(4.45)

Note that, \[18],

\[ \lambda_j = -a q^{j-1} (1 - q^j). \]

(4.46)

It follows from (4.44) that the generating function of \( Q_n(x) \) is

\[ \sum_{n=0}^{\infty} \lambda_1 \cdots \lambda_n Q_n(t; q) \frac{y^n}{(q; q)_n} \]

\[ = \frac{(y, ay; q)_\infty}{(1-q)(q, a, q/a; q)_\infty} \int_a^1 (q x, qx/a; q)_\infty d_q x \]

\[ = \frac{(ay; q)_\infty}{(a, t; q)_\infty} 2 \phi_1 \left( \frac{y}{q/a} \left| t \right| q, q \right) + \frac{(y; q)_\infty}{(1/a, at; q)_\infty} 2 \phi_1 \left( \frac{ay}{aq} \left| at \right| q, q \right) \]

\[ = \frac{(ayt, yq/t, q/ayt; q)_\infty}{(t, at, q/t, q/yt; q)_\infty} 2 \phi_1 \left( \frac{y}{yt} \left| q, q/yt \right| q, q/yt \right), \]

where the last equality follows from the transformation \[12 \ (III.32)] if we replace all the small letters by capital ones and apply the parameter identification:

\[ A = y, \quad B = ay, \quad C = yq/t, \quad Z = q/ayt. \]
Therefore
\[
\sum_{n=0}^{\infty} \lambda_1 \cdots \lambda_n Q_n(t; q) \frac{y^n}{(q; q)_n} = \frac{(ayt, yq/t, q/aty; q)_\infty}{(t, at, q/t, q/at; q)_\infty} \lim_{\delta \to 1} 2\phi_1 \left( \begin{array}{c} y, ay/yq/t \\ q, q_\delta/aty \end{array} \right)
\]
\[
= \frac{(ayt, yq/t; q)_\infty}{(t, at, q/t, q/at; q)_\infty} \lim_{\delta \to 1} 2\phi_1 \left( \begin{array}{c} q/t, q/at \\ yq/t, q \end{array} \right) \]
\[
= \frac{(ayt; q)_\infty}{(t, at; q)_\infty},
\]
where we used the transformation \[12\] (III.3) and \( \lim_{\delta \to 1} (1-\delta) \sum_{n=0}^{\infty} a_n \delta^n = \lim_{n \to \infty} a_n \). By equating the coefficients of \( y^n \) we get
\[
(4.47) \quad Q_n(t; q) = \frac{t^n}{(q; q)_n (t, at; q)_\infty}.
\]
Summarizing we get the following theorem.

**Theorem 4.5.** If \( st = qts \), then the following addition formula holds:
\[
(4.48) \quad \frac{1}{(t + s, a(t + s); q)_\infty} = \sum_{j=0}^{\infty} (-a)^j q^{(j)}(q; q)_j \frac{t^j}{(q; q)_j (t, at; q)_\infty} \frac{s^j}{(q; q)_j (s, as; q)_\infty}.
\]

4.5. **Computing first \( q \)-addition formulas using generating functions.** Recall that the Al-Salam-Carlitz polynomials \( \{U_n^{(a)}(x; q)\} \) have the generating function \[(4.44)\] and the associated functional is in \[(4.45)\]. It follows from \[(4.44)\] that the generating function of \( Q_n(t; q) \) is
\[
\sum_{n=0}^{\infty} \lambda_1 \cdots \lambda_n Q_n(t; q) \frac{y^n}{(q; q)_n}
\]
\[
= \frac{(y, ay; q)_\infty}{(1-q)(q, a, q/a; q)_\infty} \int_a^1 \frac{(qx, qx/a; q)_\infty}{(xy, xt; q)_\infty} dx
\]
\[
= \frac{(ay; q)_\infty}{(a, t; q)_\infty} 2\phi_1 \left( \begin{array}{c} y, t \\ q/a \end{array} \right) + \frac{(y; q)_\infty}{(1/a, at; q)_\infty} 2\phi_1 \left( \begin{array}{c} ay, at \\ q, q \end{array} \right)
\]
\[
= \frac{(ayt, yq/t, q/aty; q)_\infty}{(t, at, q/t, q/at; q)_\infty} 2\phi_1 \left( \begin{array}{c} y, ay/yq/t \\ q, q_\delta/aty \end{array} \right),
\]
where the last equality follows from the transformation \[12\] (III.32) if we replace all the small letters by capital ones and then take the following substitutions:
\[
A = y, \quad B = ay, \quad C = yq/t, \quad Z = q/aty.
\]
Therefore
\[
\sum_{n=0}^{\infty} \lambda_1 \cdots \lambda_n Q_n(t; q) \frac{y^n}{(q; q)_n}
\]
\[
= \frac{(ayt, yq/t, q/aty; q)_\infty}{(t, at, q/t, q/at; q)_\infty} \lim_{\delta \to 1} 2\phi_1 \left( \begin{array}{c} y, ay/yq/t \\ q, q_\delta/aty \end{array} \right)
\]
\[
= \frac{(ayt; q)_\infty}{(t, at; q)_\infty}
\]
Equating the coefficients of \( y^n \) in the above identity we get
\[
(4.49) \quad Q_n(t; q) = \frac{t^n}{(q; q)_n (t, at; q)_\infty}.
\]
Similarly we have
\[(4.50)\]
\[
\sum_{n=0}^{\infty} \lambda_1 \cdots \lambda_n \tilde{Q}_n(t; q) \frac{y^n}{(q; q)_n} = \frac{(y, ay; q)_\infty}{(1 - q)(q, a, q/a; q)_\infty} \int_0^1 (q, qx/a; q)_\infty (\cdots (-xt; q)_\infty d_qx. 
\]

The right-hand side of \[(4.50)\] is
\[
\sum_{n=0}^{\infty} \frac{(q^{n+1}/a, -ta^n; q)_\infty}{(q; q)_n (yq^n; q)_\infty} q^n - a \sum_{n=0}^{\infty} \frac{(aq^{n+1}, -taq^n; q)_\infty}{(q; q)_n (ayq^n; q)_\infty} q^n
\]
\[
= \frac{(y, ay; q)_\infty}{(a; q)_\infty} \frac{1}{3\phi_2} \begin{pmatrix} y, 0, 0 \mid q, q \end{pmatrix} + \frac{(y, -at; q)_\infty}{(1/a; q)_\infty} \frac{1}{3\phi_2} \begin{pmatrix} ay, 0, 0 \mid q, q \end{pmatrix}.
\]

In (III.34) of \[12\] replace \(a, b, c, d, e\) by \(A, B, C, D, EC\), respectively, then let \(C \to 0\), and then let \(A \to \infty\). The result is the three-term relation
\[
\begin{pmatrix} B \mid D \frac{DE}{B} \end{pmatrix} = \begin{pmatrix} E ; q \end{pmatrix} \begin{pmatrix} B, 0, 0 \mid q, q \end{pmatrix} + \begin{pmatrix} B, DE/B ; q \end{pmatrix} \begin{pmatrix} E, 0, 0 \mid q, q \end{pmatrix}.
\]

We now choose \(B = y, E = ay, D = -t\). Therefore \[(4.50)\] becomes
\[(4.51)\]
\[
\sum_{n=0}^{\infty} \lambda_1 \cdots \lambda_n \tilde{Q}_n(t; q) \frac{y^n}{(q; q)_n} = \begin{pmatrix} y \mid q, -at \end{pmatrix}.
\]

Finally we apply the \(q\)-binomial theorem in the form
\[
(y; q)_n = \sum_{k=0}^{n} \frac{(q; q)_n}{(q; q)_{k}(q; q)_{n-k}} q^k (\cdots (-y)^k
\]
and \[(4.46)\] to obtain
\[(4.52)\]
\[
\tilde{Q}_j(t; q) = \frac{(-tq^j; q)_\infty}{(q; q)_j} \begin{pmatrix} s \mid q, -at \end{pmatrix}.
\]

**Theorem 4.6.** We have the identity
\[(4.53)\]
\[
\frac{(-s; q)_\infty}{(t; q)_\infty} \sum_{n=0}^{\infty} \begin{pmatrix} -ast^n q/n ; q \end{pmatrix} (-ast)^n q^{n(n-1)} \begin{pmatrix} y \mid q, at \end{pmatrix}.
\]

**Proof.** We only need to show that the left-hand side in \[(4.53)\] is \(T_{s,q}Q_0(t; q)\). This can be seen as follows. By \[(4.13)\] and \[(4.3)\] we have
\[
T_{s,q}Q_0(t; q) = \sum_{n=0}^{\infty} \sum_{k=0}^{n} t^n a^k (-s/t; q)_n
\]
\[
= \sum_{k=0}^{\infty} t^k a^k (-s/t; q)_k \sum_{n=0}^{\infty} t^n (-sq^k/t; q)_n
\]
\[
= \frac{(-s; q)_\infty}{(t; q)_\infty} \frac{1}{2\phi_1} \begin{pmatrix} y \mid q, at \end{pmatrix}.
\]

\(\square\)
5. Sheffer-type polynomials

5.1. Moments of Sheffer-type polynomials. For the Sheffer-type orthogonal polynomials we can compute \( Q_j(t) \) by the generating function

\[
\sum_{n=0}^{\infty} \lambda_1 \ldots \lambda_n \alpha_n Q_n(t) \frac{y^n}{n!} = \mathcal{L} \left( e^{xt} \sum_{n=0}^{\infty} \alpha_n P_n(x) \frac{y^n}{n!} \right),
\]

where the \( \alpha_j \)'s are some suitably chosen constants.

The cases of Hermite, Laguerre, Meixner, and Charlier polynomials do not lead to interesting addition theorems because the addition theorem predicted by Theorem 2.1 follows from the binomial theorem. We just indicate the corresponding \( Q_j(t) \) in the addition formula of each family of polynomials.

Indeed in the case of Hermite polynomials \( \{H_n(x)\} \),

\[
\lambda_n = n/2, \quad H_n(x) = 2^n P_n(x),
\]

and

\[
Q_n(t) = \frac{t^n}{n!} \exp(t^2/4).
\]

In the case of Laguerre polynomials \( \{L_n^\alpha(x)\} \),

\[
\lambda_n = n(\alpha + n), \quad L_n^\alpha(x) = \frac{(-1)^n}{n!} P_n(x),
\]

and

\[
Q_n(t) = \frac{t^n}{n!} (1-t)^{-\alpha-n-1}.
\]

For Meixner polynomials \( \{M_n(x; \beta, c)\} \), we have

\[
\lambda_n = \frac{n(n+\beta-1)c}{(1-c)^2}, \quad M_n(x; \beta, c) = \frac{(c-1)^n}{c^n (\beta)_n} P_n(x),
\]

and

\[
Q_n(t) = \left( \frac{1-c}{1-ce^t} \right)^{\beta+n} \left( e^t - 1 \right)^n \frac{n!}{n!}.
\]

In the case of Charlier polynomials \( \{C_n(x;a)\} \),

\[
\lambda_n = an, \quad C_n(x;a) = (-a)^{-n} P_n(x).
\]

A calculation gives

\[
Q_j(t) = \frac{(e^t - 1)^j}{j!} \exp(e^t - 1).
\]

In the case of Meixner-Pollaczek polynomials \( P_n^\lambda(x; \phi) \), \[18\],

\[
\lambda_n = \frac{n(n+2\lambda-1)}{4 \sin^2 \phi}, \quad P_n^\lambda(x; \phi) = \frac{(2 \sin \phi)^n}{n!} P_n(x).
\]

One can see that the \( Q_j \)'s are given by

\[
Q_j(t) = \frac{2^j}{j!} \left( \frac{\sin \phi}{\sin(t/2 + \phi)} \right)^{2\lambda+j} [\sin(t/2)]^j.
\]

Note that for the orthogonal polynomials of Sheffer type all the \( Q_0(t) \)'s have been given in \[29\].
5.2. Sheffer-type polynomials as moments. For the Hermite polynomials, we have
\begin{equation}
\exp (2tx - t^2) = \sum_{n=0}^{\infty} \frac{H_n(x)}{n!} t^n.
\end{equation}
Let
\[ Q_n(t) = \frac{t^n}{n!} e^{2xt - t^2} = \frac{t^n}{n!} + 2(n+1)x \frac{t^{n+1}}{(n+1)!} + \cdots .\]
From \( \exp (2x(t + s) - (t + s)^2) = \exp (2tx - t^2 + 2xs - s^2 - 2ts) \) we derive the addition formula.

**Theorem 5.1.** The functions \( \{Q_j(t)\} \) have the addition formula
\begin{equation}
Q_0(t + s) = \sum_{n=0}^{\infty} n!(-2)^n Q_n(t) Q_n(s).
\end{equation}
It follows that \( \lambda_n = -2n \) and
\begin{equation}
H_{i+i+n} = \binom{i+n}{i} H_n(x).
\end{equation}

**Remark.** Radoux [22] proved (5.13) by computing the corresponding Stieltjes tableau using induction.

For the Laguerre polynomials \( L_n^{(\alpha)}(x) \) we have [13, p. 48]:
\begin{equation}
e^t \, _0F_1(-; \alpha + 1; -xt) = \sum_{n=0}^{\infty} \frac{n!L_n^{(\alpha)}(x) t^n}{(\alpha + 1)_n n!}.
\end{equation}
In (3.8), letting \( B = \alpha + \beta + 1 \) and substituting \( t \) and \( s \) by \( t/\alpha \) and \( s/\alpha \), respectively, and then letting \( \alpha \to \infty \) we get
\begin{equation}
_{0F_1}(-; B + 1; -2(t + s)) = \sum_{n=0}^{\infty} \frac{(-1)^n(B)_n(4ts)^n}{(B)_n(B+1)_n} _{0F_1}(-; B + 2n + 1; -2t)
\times _{0F_1}(-; B + 2n + 1; -2s).
\end{equation}
Let
\begin{equation}
Q_n(t; \alpha) = \frac{t^n}{n!} e^t \, _0F_1(-; \alpha + 2n + 1; -2xt), \quad n \geq 0.
\end{equation}
Then we have the following addition formula.

**Theorem 5.2.** The functions \( \{Q_j(t; \alpha)\} \) have the addition formula
\begin{equation}
Q_0(t + s; \alpha) = \sum_{n=0}^{\infty} \frac{n!(-4x^2)^n}{(\alpha+2n+1)_n} Q_n(t; \alpha) Q_n(s; \alpha).
\end{equation}
As an immediate consequence we have \( \lambda_n = \frac{n(n+1)(-4x^2)}{(\alpha+2n+1)(\alpha+2n+2)} \) and
\begin{equation}
H_{i+i+n} = \binom{n+i}{i} \frac{n!L_n^{(\alpha+2i)}(x)}{\binom{\alpha+2i+1}{\alpha+2i+1}_n}.
\end{equation}
For the Meixner polynomials \( M_n(x; \beta, c) \) we have
\begin{equation}
e^t \, _1F_1 \left( \frac{-x}{\beta} \left| \frac{1-c}{c} \right. \right) t^n = \sum_{n=0}^{\infty} \frac{M_n(x; \beta, c)}{n!} t^n.
\end{equation}
In \([3.8]\), substituting \(\alpha+1\), \(\alpha+\beta+2\), \(t\) and \(s\) by \(-x\), \(\beta\), \((c-1)t/(2c)\) and \((c-1)s/(2c)\), respectively, we obtain
\[
\begin{align*}
1F_1\left(-x \left| \frac{1-x}{c} \right. t+s\right) &= \sum_{n=0}^{\infty} \frac{n!(-x)_n}{(\beta-1)2n} \frac{(\beta+1)n(\beta-1)n}{n!} \left(\frac{1-c}{c}\right)^{2n} (ts)^n \\
&\times 1F_1\left(\frac{n-x}{\beta+2n} \left| \frac{1-c}{c} \right. t\right) 1F_1\left(\frac{n-x}{\beta+2n} \left| \frac{1-c}{c} \right. s\right).
\end{align*}
\]

Therefore, defining
\[
Q_n(x;\beta,c) = \frac{t^n}{n!} e^t 1F_1\left(\frac{n-x}{\beta+2n} \left| \frac{1-c}{c} \right. t\right),
\]
we have the following addition formula.

**Theorem 5.3.** The functions \(\{Q_j(t;\beta,c)\}\) have the addition formula
\[
Q_0(t+s;\beta,c) = \sum_{n=0}^{\infty} \frac{n!(-x)_n(\beta+1)n(\beta-1)n}{(\beta-1)2n} \left(\frac{1-c}{c}\right)^{2n} Q_n(t;\beta,c)Q_n(s;\beta,c).
\]

In the same way we derive
\[
\lambda_n = \frac{n(-x+n-1)(\beta+x+n-1)(\beta+n-2)}{(\beta+2n-2)(\beta+2n-3)(\beta+n-1)} \left(\frac{1-c}{c}\right)^{2n}
\]
and
\[
H_{i,i+n} = \binom{i+n}{i} M_n(x-i;\beta+2i,c).
\]

The Meixner-Pollaczek polynomials \(P_\lambda^{(\lambda)}(x;\phi)\) have the generating function
\[
e^t 1F_1\left(\frac{\lambda+i\lambda}{2\mu} \left| \frac{e^{-2i\phi}}{1-t}\right\right) = \sum_{n=0}^{\infty} \frac{P_\lambda^{(\lambda)}(x;\phi)}{(2\mu)^n} t^n.
\]

In \([3.8]\), substituting \(\alpha+1\), \(\beta+1\), \(t\) and \(s\) by \(\lambda-1+i\lambda, \lambda-1-i\lambda, (1-e^{-2i\phi})t/2\) and \((1-e^{-2i\phi})s/2\), respectively, and letting
\[
Q_\lambda^{(\lambda)}(x;\phi) = \frac{t^n}{n!} e^t 1F_1\left(\frac{\lambda+i\lambda+n}{2\lambda+2n} \left| \frac{e^{-2i\phi}}{1-t}\right\right),
\]
we obtain the following addition formula corresponding to Meixner-Pollaczek polynomials.

**Theorem 5.4.** We have the addition formula
\[
Q_\lambda^{(\lambda)}(t+s;\phi) = \sum_{n=0}^{\infty} \frac{n!(\lambda+i\lambda)_n(\lambda-i\lambda)_n(2\lambda-1)_n}{(2\lambda-1)2n(2\lambda)_n} 1^n Q_\lambda^{(\lambda)}(t;\phi)Q_\lambda^{(\lambda)}(s;\phi).
\]

6. \(q\)-Ultraspherical and Askey–Wilson polynomials

The continuous \(q\)-ultraspherical polynomials have the weight function
\[
w(x;\beta) = \frac{1}{2\pi} \frac{(e^{2i\theta}, e^{-2i\theta})_{\infty}}{(\beta e^{2i\theta}, \beta e^{-2i\theta})_{\infty}} \frac{1}{\sqrt{1-x^2}} \quad x = \cos \theta \in (-1, 1),
\]
and have the property
\[ C_n(x, \beta|q) = \frac{2^n(\beta)_n}{(q)_n} P_n(x), \quad \chi_j = \frac{(1 - q^j)(1 - \beta^2q^{j-1})}{4(1 - \beta q^{j-1})(1 - \beta q^{j+1})}. \]

In view of (6.10) and (6.8) we see that
\[ e^{\pi y} = \frac{2}{y} \sum_{n=0}^{\infty} (n + 1)I_{n+1}(y)U_n(x). \]

Now the special case \( \gamma = q \) of the connection relation (1.9) gives the following expansion:
\[ U_n(x) = \sum_{k=0}^{[n/2]} \frac{\beta^k(q/\beta; q)_k(q; q)_{n-k}}{(q)_k(q\beta; q)_{n-k}} 1 - \beta q^{n-2k} - \beta \frac{1}{1 - \beta} C_{n-2k}(x; \beta | q). \]

Using the above expansion and the orthogonality of the \( q \)-ultraspherical polynomials we have
\[ Q_j(t) = \frac{2}{t} \lambda_1 \cdots \lambda_j \int_{-1}^{1} \frac{w(x)(n + 1)I_{n+1}(t)U_n(x) P_j(x)dx}{(q)_n(q\beta; q)_{n-k} - \beta \frac{1}{1 - \beta} C_{n-2k}(x; \beta | q).} \]
\[ = \frac{2^{j+1}}{t} \frac{(\beta)_j}{(q)_j} \sum_{k=0}^{\infty} (j + 2k + 1)I_{j+2k+1}(t) \frac{\beta^k(q/\beta; q)_k(q; q)_{j+k}}{(q)_k(q\beta; q)_{j+k}} 1 - \beta q^j. \]
\[ = \frac{2^{j+1}}{t} \sum_{k=0}^{\infty} (j + 2k + 1)I_{j+2k+1}(t) \frac{\beta^k(q/\beta; q)_k(q^{j+1}; q)_k}{(q)_k(q\beta^{j+1}; q)_k}. \]

To denote the explicit dependence on \( q \) and \( \beta \) we set
\[ Q_j(t; \beta, q) = \frac{2^{j+1}}{t} \sum_{k=0}^{\infty} (j + 2k + 1)I_{j+2k+1}(t) \frac{\beta^k(q/\beta; q)_k(q^{j+1}; q)_k}{(q)_k(q\beta^{j+1}; q)_k}. \]

Thus we have proved that

**Theorem 6.1.** The functions \( \{Q_j(t; \beta, q)\} \) have the addition formula
\[ Q_0(s + t; \beta, q) = \sum_{n=0}^{\infty} \frac{(q; q)_n(\beta^2; q)_n}{4^n(q/\beta)_n(q; q)_n} Q_n(s; \beta, q)Q_n(t; \beta, q). \]

The special case \( \beta \to 0 \) is worth recording. Indeed if
\[ F_n(t; q) := \frac{2^{n+1}}{t} \sum_{k=0}^{\infty} (n + 2k + 1)I_{n+2k+1}(t)(-1)^n q^{(k+1)} \binom{n+k}{k}, \]
then we have established the curious result
\[ F_0(s + t; q) = \sum_{n=0}^{\infty} \frac{(q; q)_n}{4^n} F_n(s; q)F_n(t; q). \]

Another interesting case is to let \( \beta = q^\nu \); then let \( q \to 1 \). This should reduce (6.3) to (6.1) since \( \lim_{q \to 1} C_n(x; q^\nu|q) = C_n(x) \). Surprisingly the \( q \to 1 \) limit of (6.3), after setting \( \beta = q^\nu \) is
\[ Q_j(t) = 2^{j} \sum_{k=0}^{\infty} I_{j+2k}(t) \frac{(-\nu)_k(j)_k}{k!(j+1+\nu)_k} j + 2k. \]
Equating the above limit and the \(Q_j\) as in \(3.1\) leads to the following known identity involving Bessel functions:

\[
(z/2)^{\nu-\mu}J_\nu(z) = \sum_{n=0}^{\infty} \frac{\Gamma(\mu + n)\Gamma(\nu + 1 - \mu)(\mu + 2n)}{n!\Gamma(\mu + 1 - \mu - n)\Gamma(\nu + n + 1)} J_{\mu + 2n}(z);
\]

see \(7\) (7.15.2). It is also worth mentioning that \((6.7)\) is equivalent to a theorem of Bailey evaluating the sum of a well-poised \(4F_3\) with argument \(-1\), \(6\) (4.5.4).

Next we consider the Askey–Wilson polynomials whose weight function is

\[
W(x; a_1, a_2, a_3, a_4 | q) = a_1^{-n}(a_1 a_2, a_1 a_3, a_1 a_4; q)_n
\]

\[
\times \sum_{n=0}^{\infty} \prod_{j=1}^{4} (a_j e^{i\theta}, a_j e^{-i\theta}; q)^{n} \frac{1}{\sqrt{1 - x^2}}
\]

\[
\times \frac{(q; q)_\infty \prod_{1 \leq j < k \leq 4}(a_j a_k; q)^{n} x = \cos \theta.
\]

The Askey–Wilson polynomials have the basic hypergeometric function representation

\[
p_n(x; a_1, a_2, a_3, a_4 | q) = a_1^{-n}(a_1 a_2, a_1 a_3, a_1 a_4; q)_n
\]

\[
\times 4\phi_3\left(\begin{array}{c}
q^{-n}, a_1 a_2 a_3 a_4 q^{n-1}, a_1 e^{i\theta}, a_1 e^{-i\theta} \\
a_1 a_2, a_1 a_3, a_1 a_4
\end{array}; q, q, q, q, q\right).
\]

One very special case of their connection coefficients formula is \(2\) (6.4)–(6.5)

\[
p_n(x; \alpha, a_2, a_3, a_4 | q) = \sum_{k=0}^{n} c_{k,n} p_n(x; a_1, a_2, a_3, a_4 | q),
\]

where

\[
c_{k,n} = \frac{a^{n-k}(q; q)_n(a a_2 a_3 a_4 q^{n-1}; q)_k(q/a; q)^{n-k}}{(q, a a_2 a_3 a_4 q^k; q)_k(q, a a_2 a_3 a_4 q^{2k}; q)^{n-k} \prod_{2 \leq j < m \leq 4} (a_j a_m q^k; q)^{n-k} - 1}.
\]

Moreover

\[
U_n(x) = \frac{1}{(q^{n+2}; q)_n} \sqrt{q, q, -\sqrt{q}, -q^{n}q},
\]

\[
p_n(x; a, b, c, d | q) = 2^{n}(abcdnq^{n-1}; q)_n P_n(x),
\]

\[
\lambda_n = \frac{(1 - q^{n})(1 - a_1 a_2 a_3 a_4 q^{n-2}) \prod_{1 \leq j < k \leq 4}(1 - a_1 a_4 q^{n-1})}{4(a_1 a_2 a_3 a_4 q^{2n-2}; q)_2}.
\]

Applying \(2.18\) and the plane wave expansion \(6.1\) we find that the \(Q_m\)’s are given by

\[
Q_m(t) = \frac{1}{\lambda_1 \lambda_2 \cdots \lambda_m} L(e^{xt} P_m(t)) = \left(\frac{2}{t}\right)^{n} \sum_{n=0}^{\infty} (n + 1) I_{n+1}(t) L(U_n(x) P_m)
\]

\[
= \left(\frac{2}{t}\right)^{n} \sum_{n=0}^{\infty} (n + 1) I_{n+1}(t) \frac{(aq^{m+1}; q)_m a^{n-m}(q; q)_n(q^{n+2}; q)_m(q/a; q)^{n-m}}{(q^{n+2}; q)_n(q, aq^{m+1}; q)_m(q, aq^{2n+2}; q)^{n-m}}
\]

\[
\times (-q^{m+1}, q^{m+3/2}, -q^{m+3/2}; q)^{n-m}.
\]
After some simplification we arrive at

\[ Q_m(t) = \frac{q^{m+1}}{t} \sum_{n=0}^{\infty} 2^n a^n (n + m + 1) \]

\[ \times \frac{(q^{m+1}, q/a, -q^{m+1}; q)_n (q^{2m+3}, q^2)_n}{(q, aq^{2m+2}, q^{n+m+2}; q)_n} I_{n+m+1}(t). \]

(6.12)

**Theorem 6.2.** The functions \( Q_m(x) \) defined in (6.12) satisfy the addition theorem

\[ Q_0(s + t) = \sum_{n=0}^{\infty} \frac{(q^2, a^2 q; q)_n}{4^n(aq, aq^2, q)_2n} Q_n(t)Q_n(s). \]

(6.13)

7. **Ultraspherical polynomials as moments**

One of the generating functions reads

\[ Q(t) = \sum_{n=0}^{\infty} C_n^{(1/2)}(x) \frac{t^n}{(2\nu)_n} = e^{xt} \theta F_1 \left( \begin{array}{c} \nu - \frac{x^2 - 1}{4} \\ \nu + \frac{x^2 + 1}{4} \end{array} \right). \]

Let \( \cos \phi = -1 \). Then \( w = z + Z \) and \( C_n^{(1/2)}(-1) = (-1)^n \frac{(2\nu)_n}{n!} \). It follows from (1.3) that

\[ Q(t + s) = \sum_{n=0}^{\infty} \frac{(n + \nu - 1/2)(-1)^n(2\nu - 1)_n}{(\nu + 1/2)_n(\nu - 1/2)_n+1} \frac{t^n}{n!} \frac{Q_n(t)Q_n(s)}{4^n}. \]

(7.3)

where

\[ Q_n(t) = \frac{t^n}{n!} e^{xt} \theta F_1 \left( \begin{array}{c} \nu - \frac{x^2 - 1}{4} \\ \nu + \frac{x^2 + 1}{4} \end{array} \right) = \frac{t^n}{n!} + (n + 1)x \frac{t^{n+1}}{(n+1)!} + \cdots. \]

Extracting the coefficients of \( t^m s^n \) in (7.3) we get

\[ \frac{(m + n)C_{m+n}^{(\nu)}(x)}{(2\nu)_{m+n}m!n!} = \sum_{k=0}^{\infty} \frac{(k + \nu - 1/2)(-1)^k(2\nu - 1)_k(1 - x^2)^k}{k!(\nu + 1/2)_k(\nu - 1/2)_k+1} \frac{4^k}{4^k}. \]

(7.4)

Using the relation

\[ \lim_{\alpha \to +\infty} \alpha^{-n/2} C^{n+1/2}_n(x/\sqrt{\alpha}) = \frac{H_n(x)}{n!}, \]

we derive

\[ \frac{H_{m+n}(x)}{m! n!} = \sum_{k=0}^{m \land n} \frac{(-2)^k H_{m-k}(x) H_{n-k}(x)}{k! (m-k)! (n-k)!}. \]

(7.5)

An immediate consequence of (7.3) is the following formula for the Hankel determinant evaluation [28, Corollary 3].
Corollary 7.1. We have

\begin{equation}
\det \left( \frac{(i+j)!}{(2\nu)_{i+j}} c_{i+j}(x) \right)_{0 \leq i,j \leq n} = \frac{(x^2 - 1)^{n(n+1)/2}}{2^{n^2}} \prod_{r=1}^{n} \frac{r!(2\nu)_{r-1}}{(\nu + 1/2)_{r-1}(\nu + 1/2)_{r}},
\end{equation}

and more generally, for \( n \geq 0 \), the entries of the Stieltjes tableau \((2.9)\) are

\begin{equation}
\bar{H}_{i,i+n} = \sum_{k=0}^{[n/2]} \frac{(n+i)!}{i!k!(n-2k)!(\nu + 1/2 + i)k} a^{-k} \nu^k.
\end{equation}

8. A variation of the Stieltjes-Rogers addition formula

Let \( \{P_n(x)\} \) satisfy \((2.1)\) with moment sequence \( \mu_n \) and \( \bar{P}_n(x) = a^{-n}P_n(ax+b) \) \((a \neq 0)\). Then it is well known \[5, p.25\] that \( \{P_n(x)\} \) is an OPS with respect to the moments given by

\begin{equation}
\bar{\mu}_n = a^{-n} \sum_{k=0}^{n} \binom{n}{k} (-b)^{n-k} \mu_k
\end{equation}

and satisfies

\begin{equation}
\bar{P}_{n+1}(x) = \left( x - \frac{b_n - b}{a} \right) \bar{P}_n(x) - \frac{\lambda_n}{a^2} \bar{P}_{n-1}(x).
\end{equation}

Let \( Q_0(t) = \sum_{n=0}^{\infty} \mu_n \frac{t^n}{n!} \). Then it is easy to see that

\begin{equation}
\bar{Q}_0(t) = \sum_{n=0}^{\infty} \bar{\mu}_n \frac{t^n}{n!} = e^{-bt/a} Q_0(t/a).
\end{equation}

The following variation of the Stieltjes-Rogers addition formula \((2.12)\) is sometimes very useful.

Theorem 8.1. The addition formula for the moment sequence \((8.1)\) is

\begin{equation}
\bar{Q}_0(s + t) = \sum_{n=0}^{\infty} \lambda_1 \ldots \lambda_n a^{-2n} \bar{Q}_n(s) \bar{Q}_n(t),
\end{equation}

where \( \bar{Q}_n(t) = e^{-bt/a} Q_n(t/a) \). The corresponding entries in \((2.9)\) are

\begin{equation}
\bar{H}_{j,j+n} = \sum_{k=0}^{n+j} \binom{n+j}{k} (-b)^{k} a^{-n-j} \bar{H}_{j,n+j-k}.
\end{equation}

In particular we have \( \bar{H}_{n,n} = (-b/a)^{n} H_{n,n} \), i.e.,

\begin{equation}
\det(\bar{\mu}_{i+j})_{0 \leq i,j \leq n} = \left( \frac{-b}{a} \right)^n \det(\mu_{i+j})_{0 \leq i,j \leq n}.
\end{equation}

For example, let \( \mu_n = (\alpha + 1)_n \) be the \( n \)th-moment of the Laguerre polynomials \( \{L_n^\alpha(x)\} \) (see \[5,3\]). If \( a = b = 1/x \), then

\begin{equation}
\bar{\mu}_n = \sum_{k=0}^{n} \frac{(-1)^{n-k} \binom{n}{k} x^k (\alpha + 1)_k}{k!}.
\end{equation}
is a weighted derangement number. The corresponding addition formula reads

\[
\tilde{Q}_0(s + t) = \sum_{n=0}^{\infty} n!(\alpha + 1)_n x^{2n} \tilde{Q}_n(s) \tilde{Q}_n(t).
\]

The \( \alpha = 0 \) case of the above formula was derived by Radoux [22] using induction.

Acknowledgments

We are grateful to Mizan Rahman for his simplification of the \( Q_j \) functions of Sections 4 and 5 and to Tom Koornwinder for pointing out the work of Burchnall and Chaundy [4]. We thank the referee for his careful reading and helpful remarks. This work was done during the visit of the first author to Université Lyon 1 and he gratefully acknowledges the hospitality and financial support of the Institute Camille Jordan.
