

An Optimal-Order Multigrid Method for P1 Nonconforming Finite Elements

By Susanne C. Brenner

Abstract. An optimal-order multigrid method for solving second-order elliptic boundary value problems using P1 nonconforming finite elements is developed.

1. Introduction. Let Ω be a convex polygon in \mathbf{R}^2 . Let $f \in L^2(\Omega)$, $\alpha \in C^1(\bar{\Omega})$ and $\beta \in C^0(\bar{\Omega})$. We assume there exist constants α_0, β_0 such that $\alpha \geq \alpha_0 > 0$ and $\beta \geq \beta_0$, where β_0 depends on the boundary condition. In this paper we develop an optimal-order multigrid method for solving the Dirichlet problem ($\beta_0 = 0$)

$$(1.1) \quad \begin{aligned} -\nabla \cdot (\alpha \nabla u) + \beta u &= f && \text{in } \Omega, \\ u &= 0 && \text{on } \partial\Omega \end{aligned}$$

and the Neumann problem ($\beta_0 > 0$)

$$(1.2) \quad \begin{aligned} -\nabla \cdot (\alpha \nabla u) + \beta u &= f && \text{in } \Omega, \\ \frac{\partial u}{\partial n} &= 0 && \text{on } \partial\Omega, \end{aligned}$$

using P1 nonconforming finite elements (cf. [3], [4], [10]). We refer the reader to [1], [7] and [9] for conforming multigrid methods. As in [1], our multigrid method will be described in a coordinate-free fashion.

Our method consists of smoothing on the current-grid and coarser-grid correction, as in the conforming multigrid method. The important difference in the nonconforming case is that $V_{k-1} \not\subseteq V_k$, where V_k 's are the finite element spaces on mesh level k . Hence we can no longer simply use the natural injection for the intergrid transfer of grid functions. The key idea is to define an operator $I_{k-1}^k: V_{k-1} \rightarrow V_k$ that reduces to natural injection on continuous piecewise linear functions. By doing so, we can use the well-known analysis of the conforming multigrid method. We will show that the approximate solution satisfies the same type of error estimates as the discretization error and that it can be obtained in $\mathcal{O}(n)$ steps, where n is the dimension of the discretized finite element space. Since our intergrid transfer operator does not preserve either the energy or the L^2 -norm, the standard proof of convergence (cf. [2]) for the \mathcal{V} -cycle does not carry over directly. We will therefore only discuss a \mathcal{W} -cycle method, even though the \mathcal{V} -cycle method may be convergent.

The paper is organized as follows. We begin with a discussion of the notation and fundamental estimates from the theory of finite elements. The intergrid transfer operator is discussed in Section 3. Section 4 contains the results on the contracting

1980 *Mathematics Subject Classification* (1985 *Revision*). Primary 65N30, 65F10.

property of the k th level iteration followed by the convergence theorems for the nested iteration in Section 5. The singular Neumann problem ($\beta_0 = 0$ in (1.2)) will be treated in Section 6. A piecewise quadratic nonconforming finite element is discussed in the last section.

2. Preliminaries and Notation. Let $V = W_2^1(\Omega)$ for the Neumann problem (1.2) and $V = \{v \in W_2^1(\Omega) : v|_{\partial\Omega} = 0\}$ for the Dirichlet problem (1.1). Here, $W_2^1(\Omega)$ denotes the usual Sobolev space (cf. [3]). The variational formulation for (1.1) and (1.2) is to find $u \in V$ such that

$$(2.1) \quad a(u, v) = F(v) \quad \forall v \in V,$$

where

$$(2.2) \quad a(u, v) = \int_{\Omega} \alpha \nabla u \cdot \nabla v + \beta uv \quad \text{and} \quad F(v) = \int_{\Omega} f v.$$

Let $\{\mathcal{T}^k\}$, $k \geq 1$, be a family of triangulations of Ω , where \mathcal{T}^{k+1} is obtained by connecting the midpoints of the edges of the triangles in \mathcal{T}^k . Let $h_k := \max_{T \in \mathcal{T}^k} \text{diam } T$ (therefore $h_k = 2h_{k+1}$). Then there exist positive constants C_1, C_2 , independent of k , such that

$$(2.3) \quad C_2 h_k^2 \leq |T| \leq C_1 h_k^2 \quad \forall T \in \mathcal{T}^k,$$

where $|T|$ denotes the area of the triangle T . These constants depend only on the angles that appear in \mathcal{T}^1 . Throughout this paper we let C and C_i denote generic constants independent of k .

For the Dirichlet problem (1.1), define the finite element space

$$(2.4) \quad V_k := \{v : v|_T \text{ is linear for all } T \in \mathcal{T}^k, v \text{ is continuous at the midpoints of the edges and } v = 0 \text{ at the midpoints on } \partial\Omega\}.$$

For the Neumann problem (1.2), we define V_k similarly but without any restrictions on v along the boundary of Ω . Note that functions in V_k are not continuous. In other words, V_k is a nonconforming finite element space.

We also use a conforming finite element space for our analysis. Define

$$(2.5) \quad W_k := \{w : w|_T \text{ is linear for all } T \in \mathcal{T}^k, w \text{ is continuous on } \Omega \text{ and } w|_{\partial\Omega} = 0\}$$

for the Dirichlet problem (1.1). For the Neumann problem (1.2), we make no assumptions on w along the boundary of Ω . The space W_k will only be used to obtain our theoretical estimates. We emphasize that it will *not* play any role in the actual multigrid algorithm. Observe that $W_k = V_k \cap V = V_k \cap V_{k+1}$.

Let $\{\phi_1^k, \dots, \phi_{n_k}^k\}$ be the basis of V_k such that each ϕ_j^k equals 1 at exactly one midpoint and equals 0 at all other midpoints. For any linear functions ψ, ϕ on a triangle K ,

$$(2.6) \quad \int_K \psi \phi = \frac{1}{3} |K| \left(\sum_{i=1}^3 \psi(m_i) \phi(m_i) \right),$$

where the m_i 's are the midpoints of the sides of K (cf. [3, p. 183]). It follows that the ϕ_i 's are orthogonal with respect to the L^2 -inner product.

Similarity is an equivalence relation on triangles. For each equivalence class \mathcal{R} , there exist constants $C_{\mathcal{R}} > 0$ and $C'_{\mathcal{R}} > 0$ such that for any triangle $T \in \mathcal{R}$ and $v \in \mathcal{P}_1(T)$, the space of first-degree polynomials on T , we have

$$C_{\mathcal{R}}\Theta(v) \leq \int_T |\nabla v|^2 \leq C'_{\mathcal{R}}\Theta(v).$$

Here, $\Theta(v) = [v(m_1) - v(m_2)]^2 + [v(m_2) - v(m_3)]^2 + [v(m_3) - v(m_1)]^2$ and m_1, m_2, m_3 are the midpoints of the sides of T . Since any triangle in \mathcal{T}^k ($k = 1, 2, \dots$) is similar to a triangle in \mathcal{T}^1 , there exist $C_3, C_4 > 0$ such that

$$(2.7) \quad C_3\Theta(v) \leq \int_T |\nabla v|^2 \leq C_4\Theta(v)$$

for any $v \in \mathcal{P}_1(T)$, $T \in \mathcal{T}^k$, $k = 1, 2, \dots$. Moreover, as a consequence of (2.3), (2.6) and (2.7), there exists $C > 0$ such that

$$(2.8) \quad \int_T |\nabla v|^2 \leq Ch_k^{-2} \|v\|_{L^2}^2$$

for $v \in \mathcal{P}_1(T)$ and $T \in \mathcal{T}^k$.

For each k , define (on $V_k + W_2^1(\Omega)$)

$$(2.9) \quad a_k(u, v) := \sum_{T \in \mathcal{T}^k} \int_T (\alpha \nabla u \cdot \nabla v + \beta uv)$$

and

$$(2.10) \quad \|u\|_k := \sqrt{a_k(u, u)}.$$

The bilinear form $a_k(\cdot, \cdot)$ is obviously symmetric and positive definite on V_k . The stiffness matrix representing $a_k(\cdot, \cdot)$ with respect to the basis $\{\phi_1^k, \dots, \phi_{n_k}^k\}$ has at most five entries per row. As a consequence of (2.8), we have

$$(2.11) \quad \|u\|_k \leq Ch_k^{-1} \|u\|_{L^2} \quad \forall u \in V_k.$$

We also note that if $u, v \in W_2^1(\Omega)$, then $a_k(u, v) = a(u, v)$.

We now recall some fundamental estimates from the theory of finite elements.

Let Π_k and $\tilde{\Pi}_k$ be the interpolation operators associated with V_k and W_k , respectively. If $u \in W_2^2(\Omega)$, we have the following estimates for the interpolation error:

$$(2.12) \quad \|u - \Pi_k u\|_{L^2} + h_k \|u - \Pi_k u\|_k \leq Ch_k^2 \|u\|_{W_2^2}$$

and

$$(2.13) \quad \|u - \tilde{\Pi}_k u\|_{L^2} + h_k \|u - \tilde{\Pi}_k u\|_k \leq Ch_k^2 \|u\|_{W_2^2}$$

(cf. [3]).

Since $f \in L^2(\Omega)$, elliptic regularity implies that $u \in W_2^2(\Omega)$ (cf. [6]). For the same f , let $u_k \in V_k$ satisfy

$$a_k(u_k, v) = \int_{\Omega} f v \quad \forall v \in V_k$$

and let $\tilde{u}_k \in W_k$ satisfy

$$a_k(\tilde{u}_k, v) = \int_{\Omega} f v \quad \forall v \in W_k.$$

Since V_k satisfies the patch test (cf. [8], [10]), we have the following estimate for the discretization error:

$$(2.14) \quad \|u - u_k\|_{L^2} + h_k \|u - u_k\|_k \leq Ch_k^2 \|u\|_{W_2^2}$$

(cf. [4], [10]). The estimate for the conforming discretization error is, of course, well known (cf. [3]):

$$(2.15) \quad \|u - \tilde{u}_k\|_{L^2} + h_k \|u - \tilde{u}_k\|_k \leq Ch_k^2 \|u\|_{W_2^2}.$$

In [1], it was shown that \tilde{u}_k could be calculated by an iterative procedure to within an accuracy comparable to the error estimated by (2.15) using an amount of work that is proportional to the number of unknowns, namely the dimension of W_k . Our main goal in this paper is to prove a corresponding result for the computation of u_k .

From the spectral theorem, there exist eigenvalues $0 < \lambda_1 \leq \lambda_2 \leq \dots \leq \lambda_{n_k}$ and eigenfunctions $\psi_1, \psi_2, \dots, \psi_{n_k} \in V_k$, $(\psi_i, \psi_j)_{L^2} = \delta_{ij}$ (= the Kronecker delta), such that $a_k(\psi_i, v) = \lambda_i (\psi_i, v)_{L^2}$ for all $v \in V_k$. From (2.11), there exists $C_5 > 0$ such that

$$(2.16) \quad \lambda_i \leq C_5 h_k^{-2}.$$

If $v \in V_k$, we can write $v = \sum_{i=1}^{n_k} \nu_i \psi_i$. The norm $\|v\|_{s,k}$ is defined (cf. [1]) as follows:

$$(2.17) \quad \|v\|_{s,k} := \left(\sum_{i=1}^{n_k} \nu_i^2 \lambda_i^s \right)^{1/2}.$$

Note that $\|v\|_{0,k} = \|v\|_{L^2}$ and $\|v\|_{1,k} = \|v\|_k$.

Finally, it follows from the Cauchy-Schwarz inequality that

$$(2.18) \quad |a_k(v, w)| \leq \|v\|_{1+t,k} \|w\|_{1-t,k}$$

for any $t \in \mathbf{R}$ and $v, w \in V_k$.

3. The Intergrid Transfer Operator. For $v \in V_{k-1}$ the intergrid transfer operator $I_{k-1}^k: V_{k-1} \rightarrow V_k$ is defined as follows. Let p be a midpoint of a side of a triangle in \mathcal{T}^k . If p lies in the interior of a triangle in \mathcal{T}^{k-1} , then we define

$$(I_{k-1}^k v)(p) := v(p).$$

Otherwise, if p lies on the common edge of two adjacent triangles T_1 and T_2 in \mathcal{T}^{k-1} , then we define

$$(I_{k-1}^k v)(p) := \frac{1}{2} [v|_{T_1}(p) + v|_{T_2}(p)].$$

Note that the matrix for I_{k-1}^k with respect to the bases $\{\phi_1^{k-1}, \dots, \phi_{n_{k-1}}^{k-1}\}$ and $\{\phi_1^k, \dots, \phi_{n_k}^k\}$ has at most five entries per row.

From the definition of I_{k-1}^k , it is clear that

$$(3.1) \quad I_{k-1}^k v = v \quad \forall v \in W_{k-1} = V_k \cap V_{k-1} \subseteq V.$$

In other words, $I_{k-1}^k|_{W_{k-1}}$ is just the natural injection.

LEMMA 1. *There exists $C > 0$ such that*

$$(3.2) \quad \|I_{k-1}^k v\|_k \leq C \|v\|_{k-1}$$

and

$$(3.3) \quad \|I_{k-1}^k v\|_{L^2} \leq C \|v\|_{L^2}$$

for all $v \in V_{k-1}$.

Proof. The inequality (3.3) follows immediately from (2.6), the definition of I_{k-1}^k and the quasi-uniformity of the triangulations.

Inequality (3.2) can be deduced from (3.3) as follows. Given $v \in V_{k-1}$, define $g \in V_{k-1}$ by

$$(3.4) \quad \int_{\Omega} g \phi = a_{k-1}(v, \phi) \quad \forall \phi \in V_{k-1},$$

$w \in W_{k-1}$ by

$$(3.5) \quad a_k(w, \phi) = \int_{\Omega} g \phi \quad \forall \phi \in W_{k-1},$$

and $z \in V$ by

$$(3.6) \quad a(z, \phi) = \int_{\Omega} g \phi \quad \forall \phi \in V.$$

Then (3.3), (2.11), (2.14), (2.15) and elliptic regularity imply that

$$(3.7) \quad \begin{aligned} \|I_{k-1}^k v\|_k &\leq \|I_{k-1}^k(v-w)\|_k + \|w\|_k \\ &\leq Ch_k^{-1} \|I_{k-1}^k(v-w)\|_{L^2} + \|w-v\|_{k-1} + \|v\|_{k-1} \\ &\leq Ch_k^{-1} \|v-w\|_{L^2} + \|v\|_{k-1} \\ &\leq Ch_k^{-1} [\|v-z\|_{L^2} + \|w-z\|_{L^2}] + \|v\|_{k-1} \\ &\leq Ch_k \|z\|_{W_2^2} + \|v\|_{k-1} \leq Ch_k \|g\|_{L^2} + \|v\|_{k-1}. \end{aligned}$$

But

$$\|g\|_{L^2}^2 = a_{k-1}(v, g) \leq \|v\|_{k-1} \|g\|_{k-1} \leq Ch_{k-1}^{-1} \|v\|_{k-1} \|g\|_{L^2}.$$

Therefore,

$$(3.8) \quad \|g\|_{L^2} \leq Ch_{k-1}^{-1} \|v\|_{k-1}.$$

Combining (3.7) and (3.8), we obtain (3.2). \square

4. Contracting Properties of the k th Level Iteration. The k th level iteration with initial guess z_0 yields $MG(k, z_0, G)$ as an approximate solution to the following problem.

Find $z \in V_k$ such that $a_k(z, v) = G(v) \quad \forall v \in V_k$, where $G \in V_k'$.

For $k = 1$, $MG(1, z_0, G)$ is the solution obtained from a direct method. For $k > 1$, $MG(k, z_0, G) = z_m + I_{k-1}^k q_p$, where the approximation $z_m \in V_k$ is constructed recursively from the initial guess z_0 and the equations

$$(z_i - z_{i-1}, v)_{L^2} = (\Lambda_k)^{-1} (G(v) - a_k(z_{i-1}, v)), \quad \forall v \in V_k, \quad 1 \leq i \leq m.$$

Here, $\Lambda_k = C_5 h_k^{-2}$ (cf. (2.16)), which is greater than or equal to $\max_{1 \leq i \leq n_k} \lambda_i$, and m is an integer to be determined later. With respect to $\{\phi_1^k, \dots, \phi_{n_k}^k\}$, z_m

can be obtained from z_0 by iterating a sparse band matrix because the ϕ_i^k 's are L^2 -orthogonal. The coarser-grid correction $q_p \in V_{k-1}$ is obtained by applying the $(k-1)$ -level iteration p times ($p = 2, 3$). More precisely,

$$\begin{aligned} q_0 &= 0, \\ q_i &= MG(k-1, q_{i-1}, \bar{G}), \quad 1 \leq i \leq p, \end{aligned}$$

where $\bar{G} \in V'_{k-1}$ is defined by $\bar{G}(v) := G(I_{k-1}^k v) - a_k(z_m, I_{k-1}^k v) \forall v \in V_{k-1}$.

The main result in this section is the following theorem.

THEOREM 1. *If the number of smoothing steps is large enough, then the k th level iteration is a contraction for both the energy norm and the L^2 -norm. Moreover, the contraction number is independent of k .*

Theorem 1 is a trivial consequence of the following lemmas. In order to simplify the notation, we define the statements

(S_k) : When the k th level iteration is applied to the problem of finding $z \in V_k$ such that $a_k(z, v) = G(v) \forall v \in V_k$, we have $\|z - MG(k, z_0, G)\|_k \leq \gamma \|z - z_0\|_k$,

and

(\bar{S}_k) : When the k th level iteration is applied to the problem of finding $z \in V_k$ such that $a_k(z, v) = G(v) \forall v \in V_k$, we have $\|z - MG(k, z_0, G)\|_{L^2} \leq \bar{\gamma} \|z - z_0\|_{L^2}$.

LEMMA 2. *There exists $\gamma \in (0, 1)$ and an integer $m \geq 1$, both independent of k , such that*

$$(S_{k-1}) \text{ implies } (S_k).$$

LEMMA 3. *There exists $\bar{\gamma} \in (0, 1)$ and an integer $m \geq 1$, both independent of k , such that*

$$(\bar{S}_{k-1}) \text{ implies } (\bar{S}_k).$$

Our analysis is based on estimates of the following errors. Let $e_0 := z - z_0$, $e_m := z - z_m$ and $e_f := z - MG(k, z_0, G)$. Also let $e \in V_{k-1}$ satisfy

$$(4.1) \quad a_{k-1}(e, v) = \bar{G}(v) = a_k(e_m, I_{k-1}^k v) \quad \forall v \in V_{k-1},$$

and let $\tilde{e} \in W_{k-1}$ satisfy

$$(4.2) \quad a_{k-1}(\tilde{e}, v) = \bar{G}(v) = a_k(e_m, I_{k-1}^k v) = a_k(e_m, v) \quad \forall v \in W_{k-1}.$$

As in the conforming case (cf. [1]), we have the following effects of the smoothing steps.

LEMMA 4. *There exists $C > 0$ such that*

$$(4.3) \quad \|e_m\|_{L^2} \leq \|e_0\|_{L^2},$$

$$(4.4) \quad \|e_m\|_k \leq \|e_0\|_k$$

and

$$(4.5) \quad \| \|e_m\| \|_{2,k} \leq Ch_k^{-1} m^{-1/2} \| \|e_0\| \|_{1,k} = Ch_k^{-1} m^{-1/2} \|e_0\|_k.$$

From (4.1) and (3.2) we have

$$\|e\|_{k-1}^2 = a_k(e_m, I_{k-1}^k e) \leq \|e_m\|_k \|I_{k-1}^k e\|_k \leq C \|e_m\|_k \|e\|_{k-1}.$$

Therefore, there exists $C > 0$ such that

$$(4.6) \quad \|e\|_{k-1} \leq C \|e_m\|_k \leq C \|e_0\|_k.$$

Since e and \tilde{e} are approximate solutions in different spaces to the same problem (cf. (4.1) and (4.2)), they are close to each other.

LEMMA 5. *There exists $C > 0$ such that*

$$(4.7) \quad \|e - \tilde{e}\|_{L^2} \leq Ch_k m^{-1/2} \|e_0\|_{L^2}$$

and

$$(4.8) \quad \|e - \tilde{e}\|_{k-1} \leq Cm^{-1/2} \|e_0\|_k.$$

Proof. Let $f_0 \in V_{k-1}$ satisfy

$$(f_0, v)_{L^2} = a_k(e_m, I_{k-1}^k v) \quad \forall v \in V_{k-1}.$$

It follows from (2.18) and (3.2) that

$$\begin{aligned} \|f_0\|_{L^2}^2 &= a_k(e_m, I_{k-1}^k f_0) \leq \|e_m\|_{2,k} \|I_{k-1}^k f_0\|_{0,k} \\ &\leq C \|e_m\|_{2,k} \|f_0\|_{L^2}. \end{aligned}$$

Therefore,

$$(4.9) \quad \|f_0\|_{L^2} \leq C \|e_m\|_{2,k}.$$

Let $v_0 \in W_2^2(\Omega)$ satisfy

$$-\nabla \cdot (\alpha \nabla v_0) + \beta v_0 = f_0 \quad \text{in } \Omega, \quad v_0 = 0 \quad \text{on } \partial\Omega \quad \left(\frac{\partial v_0}{\partial n} = 0 \text{ on } \partial\Omega \right)$$

in the Dirichlet (Neumann) case. Note that e and \tilde{e} are the finite element (Galerkin) approximations to v_0 in V_{k-1} and W_{k-1} , respectively. By (2.14) and (2.15), we have $\|v_0 - e\|_{L^2} + h_{k-1} \|v_0 - e\|_{k-1} \leq Ch_{k-1}^2 \|v_0\|_{W_2^2}$ and $\|v_0 - \tilde{e}\|_{L^2} + h_{k-1} \|v_0 - \tilde{e}\|_{k-1} \leq Ch_{k-1}^2 \|v_0\|_{W_2^2}$.

Since $h_{k-1} = 2h_k$, it follows from the triangle inequality that

$$\|e - \tilde{e}\|_{L^2} + h_k \|e - \tilde{e}\|_{k-1} \leq Ch_k^2 \|v_0\|_{W_2^2}.$$

By elliptic regularity, $\|v_0\|_{W_2^2} \leq C \|f_0\|_{L^2}$. Therefore, from (4.9) we obtain

$$(4.10) \quad \|e - \tilde{e}\|_{L^2} + h_k \|e - \tilde{e}\|_{k-1} \leq Ch_k^2 \|e_m\|_{2,k}.$$

The inequalities (4.7) and (4.8) now follow from (4.10) and (4.5). \square

Next, observe that from (4.2) and the fact that $W_{k-1} \subseteq V$ we have an orthogonality relation,

$$(4.11) \quad a_k(e_m - \tilde{e}, v) = 0 \quad \forall v \in W_{k-1}.$$

The analysis of $e_m - \tilde{e}$ is similar to the one used in conforming multigrid methods.

LEMMA 6. *There exists $C > 0$ such that*

$$(4.12) \quad \|e_m - \tilde{e}\|_{L^2} \leq Cm^{-1/2} \|e_0\|_{L^2}$$

and

$$(4.13) \quad \|e_m - \tilde{e}\|_k \leq Cm^{-1/2} \|e_0\|_k.$$

Proof. By (4.11), (2.18) and (4.5) we have

$$(4.14) \quad \begin{aligned} \|e_m - \tilde{e}\|_k^2 &= a_k(e_m - \tilde{e}, e_m - \tilde{e}) = a_k(e_m - \tilde{e}, e_m) \\ &\leq \|e_m - \tilde{e}\|_{0,k} \|e_m\|_{2,k} \\ &\leq Ch_k^{-1} m^{-1/2} \|e_m - \tilde{e}\|_{0,k} \|e_0\|_k. \end{aligned}$$

We will use a duality argument to estimate $\|e_m - \tilde{e}\|_{0,k} = \|e_m - \tilde{e}\|_{L^2}$. Let $w \in W_2^2(\Omega)$ satisfy

$$-\nabla \cdot (\alpha \nabla w) + \beta w = e_m - \tilde{e} \quad \text{in } \Omega, \quad w = 0 \quad \text{on } \partial\Omega \quad \left(\frac{\partial w}{\partial n} = 0 \text{ on } \partial\Omega \right)$$

in the Dirichlet (Neumann) case. Let $w_k \in V_k$ satisfy

$$a_k(w_k, v) = \int_{\Omega} (e_m - \tilde{e})v \quad \forall v \in V_k.$$

Then

$$\begin{aligned} \|e_m - \tilde{e}\|_{L^2}^2 &= \int_{\Omega} (e_m - \tilde{e})(e_m - \tilde{e}) = a_k(w_k, e_m - \tilde{e}) \\ &= a_k(w - v, e_m - \tilde{e}) + a_k(w_k - w, e_m - \tilde{e}) \end{aligned}$$

for any $v \in W_{k-1}$ by the orthogonality relation (4.11). Therefore, by the approximation property (2.13), the discretization error estimate (2.14) and elliptic regularity we have

$$\begin{aligned} \|e_m - \tilde{e}\|_{L^2}^2 &\leq \inf_{v \in W_{k-1}} \|w - v\|_k \|e_m - \tilde{e}\|_k + \|w_k - w\|_k \|e_m - \tilde{e}\|_k \\ &\leq Ch_k \|w\|_{W_2^2} \|e_m - \tilde{e}\|_k \leq Ch_k \|e_m - \tilde{e}\|_{L^2} \|e_m - \tilde{e}\|_k. \end{aligned}$$

Thus,

$$(4.15) \quad \|e_m - \tilde{e}\|_{L^2} \leq Ch_k \|e_m - \tilde{e}\|_k.$$

The inequality (4.13) now follows by combining (4.14) and (4.15).

From (4.15), (4.13) and (2.11) it follows that

$$\begin{aligned} \|e_m - \tilde{e}\|_{L^2} &\leq Ch_k \|e_m - \tilde{e}\|_k \\ &\leq Cm^{-1/2} h_k \|e_0\|_k \leq Cm^{-1/2} \|e_0\|_{L^2}. \quad \square \end{aligned}$$

Proof of Lemma 2. Recall that $e_f = z - MG(k, z_0, G)$ and $e_0 = z - z_0$. We have by (3.1)

$$\begin{aligned} \|e_f\|_k &= \|e_m - I_{k-1}^k q_p\|_k \\ &\leq \|e_m - \tilde{e}\|_k + \|I_{k-1}^k(\tilde{e} - e)\|_k + \|I_{k-1}^k(e - q_p)\|_k. \end{aligned}$$

From (4.13), (4.8), (3.2) and (S_{k-1}) , it follows that

$$\|e_f\|_k \leq Cm^{-1/2} \|e_0\|_k + C\gamma^p \|e\|_{k-1}.$$

But (4.6) yields

$$\|e_f\|_k \leq (Cm^{-1/2} + C\gamma^p) \|e_0\|_k.$$

If $\gamma \in (0, 1)$ is small enough, then $C\gamma^p < \gamma/2$ (since $p > 1$). If m is large enough, then $Cm^{-1/2} < \gamma/2$. For such choices, we have

$$\|e_f\|_k \leq \gamma \|e_0\|_k. \quad \square$$

Proof of Lemma 3. We have by (3.1)

$$\|e_f\|_{L^2} \leq \|e_m - \tilde{e}\|_{L^2} + \|I_{k-1}^k(\tilde{e} - e)\|_{L^2} + \|I_{k-1}^k(e - q_p)\|_{L^2}.$$

By (4.12), (4.7), (3.3) and (\bar{S}_{k-1}) it follows that

$$(4.16) \quad \|e_f\|_{L^2} \leq Cm^{-1/2}\|e_0\|_{L^2} + C\bar{\gamma}^p\|e\|_{L^2}.$$

But

$$\begin{aligned} \|e\|_{L^2} &\leq \|e - \tilde{e}\|_{L^2} + \|\tilde{e} - e_m\|_{L^2} + \|e_m\|_{L^2} \\ &\leq Cm^{-1/2}\|e_0\|_{L^2} + \|e_0\|_{L^2} \end{aligned}$$

by (4.7), (4.12) and (4.3). Therefore, $\|e\|_{L^2} \leq C\|e_0\|_{L^2}$. Hence from (4.16),

$$\|e_f\|_{L^2} \leq (Cm^{-1/2} + C\bar{\gamma}^p)\|e_0\|_{L^2}.$$

If $\bar{\gamma} \in (0, 1)$ is small enough, then $C\bar{\gamma}^p < \bar{\gamma}/2$. If m is large enough, then $Cm^{-1/2} < \bar{\gamma}/2$. For such choices we have

$$\|e_f\|_{L^2} \leq \bar{\gamma}\|e_0\|_{L^2}. \quad \square$$

5. Nested Iteration. We have a sequence of discretizations for the problem (1.1) or (1.2). For each k , we want to find an approximate solution \hat{u}_k to the problem of finding $u_k \in V_k$ such that

$$a_k(u_k, v) = \int_{\Omega} f v \quad \forall v \in V_k.$$

In the overall multigrid strategy, \hat{u}_1 is obtained by a direct method. The approximations \hat{u}_k ($k \geq 2$) are obtained recursively by

$$\begin{aligned} u_0^j &= I_{j-1}^j \hat{u}_{j-1}, \\ u_l^j &= MG(j, u_{l-1}^j, F), \quad 1 \leq l \leq r, \quad F(v) = \int_{\Omega} f v, \\ \hat{u}_j &= u_r^j. \end{aligned}$$

Here r is an integer to be determined.

Define $\hat{e}_k := u_k - \hat{u}_k$. In particular, $\hat{e}_1 = 0$. Lemma 2, (2.14), (2.13), (3.1) and (3.2) imply that

$$\begin{aligned} \|\hat{e}_k\|_k &\leq \gamma^r \|u_k - I_{k-1}^k \hat{u}_{k-1}\|_k \\ &\leq \gamma^r \{ \|u_k - u\|_k + \|u - \tilde{\Pi}_{k-1} u\|_k + \|I_{k-1}^k(\tilde{\Pi}_{k-1} u - \hat{u}_{k-1})\|_k \} \\ &\leq C\gamma^r \{ h_k \|u\|_{W_2^2} + \|\tilde{\Pi}_{k-1} u - \hat{u}_{k-1}\|_{k-1} \} \\ &\leq C\gamma^r \{ h_k \|u\|_{W_2^2} + \|\tilde{\Pi}_{k-1} u - u\|_{k-1} + \|u - u_{k-1}\|_{k-1} + \|u_{k-1} - \hat{u}_{k-1}\|_{k-1} \} \\ &\leq C\gamma^r \{ h_k \|u\|_{W_2^2} + h_{k-1} \|u\|_{W_2^2} + \|\hat{e}_{k-1}\|_{k-1} \}. \end{aligned}$$

Since $h_{k-1} = 2h_k$,

$$(5.1) \quad \|\hat{e}_k\|_k \leq Ch_k \gamma^r \|u\|_{W_2^2} + C\gamma^r \|\hat{e}_{k-1}\|_{k-1}.$$

By iterating (5.1) we have

$$\begin{aligned} \|\hat{e}_k\|_k &\leq Ch_k\gamma^r\|u\|_{W_2^2} + C^2h_{k-1}\gamma^{2r}\|u\|_{W_2^2} + \cdots + C^k h_1\gamma^{kr}\|u\|_{W_2^2} \\ &\leq \|u\|_{W_2^2} \frac{h_k C \gamma^r}{1 - 2C\gamma^r} \end{aligned}$$

if $2C\gamma^r < 1$. Therefore,

$$(5.2) \quad \|\hat{e}_k\|_k \leq Ch_k\|u\|_{W_2^2}.$$

In summary, we have proved the following theorem.

THEOREM 2. *If r is large enough, then there exists a constant $C > 0$ such that*

$$\|u - \hat{u}_k\|_k \leq Ch_k\|u\|_{W_2^2}.$$

Similarly, we can prove the following theorem for the L^2 -error.

THEOREM 3. *If r is large enough, then there exists a constant $C > 0$ such that*

$$\|u - \hat{u}_k\|_k \leq Ch_k^2\|u\|_{W_2^2}.$$

THEOREM 4. *The cost for obtaining \hat{u}_k is $\mathcal{O}(n_k)$, where n_k is the dimension of V_k .*

Proof. This is a consequence of the fact that $p = 2, 3$ and that the number of nonzero entries in the stiffness matrices, the smoothing iteration matrices and the intergrid transfer matrices are all proportional to n_k . The proof is the same as the one in [1]. \square

6. The Singular Neumann Problem. When $\beta \equiv 0$ in (1.2), the necessary and sufficient condition for the existence of a solution is

$$(6.1) \quad \int_{\Omega} f = 0.$$

If (6.1) is satisfied, there exists a unique solution u in $\hat{V} = \{v \in W_2^1(\Omega) : \int_{\Omega} v = 0\}$. The multigrid method developed in earlier sections can be modified to yield approximate solutions of u . Let $\hat{V}_k = \{v \in V_k : \int_{\Omega} v = 0\}$ and $\hat{W}_k = \{w \in W_k : \int_{\Omega} w = 0\}$. Let $u_k \in \hat{V}_k$ satisfy

$$(6.2) \quad a_k(u_k, v) = \int_{\Omega} f v \quad \forall v \in \hat{V}_k$$

and $\tilde{u}_k \in \hat{W}_k$ satisfy

$$(6.3) \quad a_k(\tilde{u}_k, v) = \int_{\Omega} f v \quad \forall v \in \hat{W}_k.$$

Then

$$(6.4) \quad \begin{aligned} \|u - \tilde{u}_k\|_k &= \inf_{v \in \hat{W}_k} \|u - v\|_k \\ &\leq \left\| u - \left(\tilde{\Pi}_k u - \frac{1}{|\Omega|} \int_{\Omega} \tilde{\Pi}_k u \right) \right\|_k \\ &= \|u - \tilde{\Pi}_k u\|_k \leq Ch_k\|u\|_{W_2^2}. \end{aligned}$$

A duality argument shows that

$$(6.5) \quad \|u - \tilde{u}_k\|_{L^2} \leq Ch_k^2\|u\|_{W_2^2}.$$

The analog of (2.15) therefore holds for the space \hat{W}_k .

To estimate $\|u - u_k\|_k$, we start with the formula (cf. [8])

$$(6.6) \quad \|u - u_k\|_k \leq \inf_{v \in \hat{V}_k} \|u - v\|_k + \sup_{v \in \hat{V}_k} \frac{|a_k(u - u_k, v)|}{\|v\|_k}.$$

By arguments similar to those that led to (6.4), we see that the first term is bounded by $Ch_k \|u\|_{W_2^2}$. The second term is also bounded by $Ch_k \|u\|_{W_2^2}$; the analysis is similar to that in [4]. Therefore,

$$(6.7) \quad \|u - u_k\|_k \leq Ch_k \|u\|_{W_2^2}.$$

Again, a duality argument (cf. the proof of (4.15)) shows that

$$(6.8) \quad \|u - u_k\|_{L^2} \leq Ch_k^2 \|u\|_{W_2^2}.$$

Thus the analog of (2.14) holds for \hat{V}_k .

The operator I_{k-1}^k defined in Section 3 must be modified so that it maps \hat{V}_{k-1} into \hat{V}_k . We define $\hat{I}_{k-1}^k: \hat{V}_{k-1} \rightarrow \hat{V}_k$ by

$$(6.9) \quad \hat{I}_{k-1}^k v := I_{k-1}^k v - \frac{1}{|\Omega|} \int_{\Omega} I_{k-1}^k v.$$

The computation of the integral involves only $\mathcal{O}(n_k)$ operations (using the quadrature formula (2.6)). Note that $\hat{I}_{k-1}^k w = w$ for all $w \in \hat{W}_{k-1}$.

We have, by (3.2),

$$(6.10) \quad \|\hat{I}_{k-1}^k v\|_k = \|I_{k-1}^k v\|_k \leq C \|v\|_{k-1}$$

and, by the Cauchy-Schwarz inequality and (3.3),

$$(6.11) \quad \begin{aligned} \|\hat{I}_{k-1}^k v\|_{L^2} &= \left\| I_{k-1}^k v - \frac{1}{|\Omega|} \int_{\Omega} I_{k-1}^k v \right\|_{L^2} \\ &\leq \|I_{k-1}^k v\|_{L^2} + \left\| \frac{1}{|\Omega|} \int_{\Omega} I_{k-1}^k v \right\|_{L^2} \\ &\leq 2 \|I_{k-1}^k v\|_{L^2} \leq C \|v\|_{L^2}. \end{aligned}$$

Because of (6.4), (6.5), (6.7), (6.8), (6.10) and (6.11), the theory developed in earlier sections carries over to this case if we replace V, V_k, W_k and I_{k-1}^k by $\hat{V}, \hat{V}_k, \hat{W}_k$ and \hat{I}_{k-1}^k , respectively.

In practice we can use the same scheme with I_{k-1}^k replaced by \hat{I}_{k-1}^k and V_1 replaced by \hat{V}_1 . The solution obtained is in \hat{V}_k since the zero mean value is preserved by the intergrid transfer operator, the smoothing steps and the coarser-grid correction.

7. Extension to a Quadratic Nonconforming Finite Element. The principles which led to our optimal-order multigrid method for P1 nonconforming elements can also be applied to higher-order nonconforming finite elements. In this section we will indicate how this can be done for a quadratic nonconforming finite element (cf. [5]). For simplicity, we restrict our discussion to the Dirichlet problem for the Laplace equation

$$(7.1) \quad \begin{aligned} -\Delta u &= f && \text{in } \Omega, \\ u &= 0 && \text{on } \partial\Omega, \end{aligned}$$

where Ω is a convex polygon.

Let $V = \{v \in W_2^1(\Omega) : v|_{\partial\Omega} = 0\}$ and $a(u, v) = \int_{\Omega} \nabla u \cdot \nabla v$ for $u, v \in V$. Then the variational formulation for (7.1) is to find $u \in V$ such that

$$(7.2) \quad a(u, v) = \int f v \quad \forall v \in V.$$

We assume that $u \in W_2^3(\Omega) \cap V$ in order to fully exploit the properties of the quadratic element.

FIGURE 1

Let K be a triangle. The barycentric coordinates of the six Gauss-Legendre points $p_1, p_2, p_3, p_4, p_5, p_6$ along the sides of K (cf. Figure 1) are obtained by permuting

$$\left(\frac{1}{2} \left(1 + \frac{\sqrt{3}}{3} \right), \frac{1}{2} \left(1 - \frac{\sqrt{3}}{3} \right), 0 \right).$$

If g is a quadratic polynomial on K , then

$$(7.3) \quad g(p_6) - g(p_5) + g(p_4) - g(p_3) + g(p_2) - g(p_1) = 0$$

(cf. [5]).

Let $\beta, \alpha_1, \alpha_2, \alpha_3, \alpha_4, \alpha_5, \alpha_6 \in \mathbf{R}$ such that $\sum_{i=1}^6 (-1)^i \alpha_i = 0$. Then there is exactly one quadratic polynomial g such that $g(p_i) = \alpha_i$ and $g(\text{centroid}) = \beta$.

Let \mathcal{T}^k be the family of triangulations described in Section 2. Define

$$(7.4) \quad V_k := \{v : v|_T \text{ is a quadratic polynomial for each } T \in \mathcal{T}^k, v \text{ is continuous at the Gauss-Legendre points of interelement boundaries and } v \text{ vanishes at the Gauss-Legendre points on } \partial\Omega\}$$

and

$$(7.5) \quad W_k := \{w : w|_T \text{ is a quadratic polynomial for each } T \in \mathcal{T}^k, w \text{ is continuous on } \Omega \text{ and } w \equiv 0 \text{ on } \partial\Omega\}.$$

Again, note that $W_k = V_k \cap V = V_k \cap V_{k+1}$.

For each k , define

$$(7.6) \quad a_k(v_1, v_2) = \sum_{T \in \mathcal{T}^k} \int_T \nabla v_1 \cdot \nabla v_2 \quad \text{for } v_1, v_2 \in V + V_k$$

and

$$(7.7) \quad \|v\|_k = a_k(v, v)^{1/2}.$$

FIGURE 2

Let $u_k \in V_k$ satisfy

$$a_k(u_k, v) = \int f v \quad \forall v \in V_k,$$

and $\tilde{u}_k \in W_k$ satisfy

$$a_k(\tilde{u}_k, v) = \int f v \quad \forall v \in W_k.$$

Then we have the estimates

$$(7.8) \quad \|u - u_k\|_{L^2} + h_k \|u - u_k\|_k \leq C h_k^3 \|u\|_{W_2^3}$$

and

$$(7.9) \quad \|u - \tilde{u}_k\|_{L^2} + h_k \|u - \tilde{u}_k\|_k \leq C h_k^3 \|u\|_{W_2^3}.$$

Inequality (7.9) is well known. Inequality (7.8) holds because the nonconforming element satisfies the patch test (cf. [4], [5]). The theory for P1 nonconforming finite elements can be extended to this case in a straightforward manner if we can find an operator $I_{k-1}^k: V_{k-1} \rightarrow V_k$ such that (i) it is a bounded linear operator with respect to both the L^2 norm and the energy norm and (ii) it reduces to the natural injection on W_{k-1} .

For $v \in V_{k-1}$, the operator $I_{k-1}^k: V_{k-1} \rightarrow V_k$ is defined as follows.

Let p be a Gauss-Legendre point of a side of a triangle in \mathcal{T}^k . If p lies on the common edge of two adjacent triangles Δ_1 and Δ_2 in \mathcal{T}^{k-1} , then

$$(I_{k-1}^k v)(p) := \frac{1}{2} [v|_{\Delta_1}(p) + v|_{\Delta_2}(p)].$$

If p lies inside a triangle T in \mathcal{T}^{k-1} , then there are two cases to consider. $I_{k-1}^k v$ assumes the same values as v at the points b_2, b_4 and b_6 ; the value of $I_{k-1}^k v$ at the points b_1, b_3 and b_5 is determined by condition (7.3) applied to the three outer triangles T_1, T_2, T_3 (cf. Figure 2). To complete the definition of the intergrid transfer operator we must verify that the values of $I_{k-1}^k v$ at the six Gauss-Legendre points of T_4 satisfy (7.3). Then we let $I_{k-1}^k v$ take the same value as v at the centroids of T_1, T_2, T_3 and T_4 .

LEMMA 7. Let p_1, \dots, p_{12} be the Gauss-Legendre points along the boundary of $T \in \mathcal{T}^k$ (cf. Figure 2). Then

$$(7.10) \quad \sum_{i=1}^{12} (-1)^i (I_{k-1}^k v)(p_i) = \sum_{i=1}^{12} (-1)^i v|_T(p_i).$$

Proof. Let e denote the edge that contains p_1, p_2, p_3 and p_4 . We have

$$(7.11) \quad \sum_{i=1}^4 (-1)^i (I_{k-1}^k v)(p_i) = \sum_{i=1}^4 (-1)^i v|_T(p_i) + \sum_{i=1}^4 \frac{(-1)^i}{2} [v|_{T'}(p_i) - v|_T(p_i)],$$

where T' is the neighboring triangle in \mathcal{T}^{k-1} that also contains e . On e , $q := v|_{T'} - v|_T$ is a quadratic polynomial that vanishes at the two Gauss-Legendre points of the original triangle T , which are symmetric with respect to the midpoint. Therefore q is symmetric with respect to the midpoint of e . Thus $q(p_4) = q(p_1)$ and $q(p_3) = q(p_2)$. Hence the second sum on the right-hand side of (7.11) adds up to zero.

Since a similar equality holds for each edge, Lemma 7 is now proved. \square

Because v satisfies (7.3) on T_1, T_2 and T_3 ,

$$(7.12) \quad \sum_{i=1}^{12} (-1)^i v(p_i) + \sum_{j=1}^6 (-1)^j v(b_j) = 0.$$

But v also satisfies (7.3) on T_4 , hence

$$(7.13) \quad \sum_{j=1}^6 (-1)^j v(b_j) = 0.$$

Equalities (7.12), (7.13) and Lemma 7 then imply that

$$\sum_{i=1}^{12} (-1)^i (I_{k-1}^k v)(p_i) = 0.$$

But by construction,

$$\sum_{i=1}^{12} (-1)^i (I_{k-1}^k v)(p_i) + \sum_{j=1}^6 (-1)^j (I_{k-1}^k v)(b_j) = 0.$$

Therefore,

$$\sum_{j=1}^6 (-1)^j (I_{k-1}^k v)(b_j) = 0,$$

and the compatibility condition on T_4 is satisfied. Hence $I_{k-1}^k v$ is well defined.

By our definition of $I_{k-1}^k v$, it is obvious that $I_{k-1}^k w = w$ for $w \in W_{k-1}$.

The proof of Lemma 1 is still applicable for this intergrid transfer operator. Therefore, I_{k-1}^k is bounded with respect to both the L^2 and energy norms.

As indicated earlier, once I_{k-1}^k has these properties we can obtain a multigrid method for finding approximate solutions \hat{u}_k of u_k such that

$$\|u - \hat{u}_k\|_{L^2} + h_k \|u - \hat{u}_k\|_k \leq Ch_k^3 \|u\|_{W_2^3}.$$

Acknowledgments. Special thanks go to the author's advisor, Professor Ridgway Scott, for his advice and encouragement. I would also like to thank the referee for helpful suggestions and for the simple proof of Lemma 1.
