In this paper we study the existence of positive solution of a class of nonlinear eigenvalue problems involving the  $p(x)$ -Laplace operator with zero Dirichlet boundary condition, where  $p$  is a continuous functions satisfying  $p(x) > 1, \forall x$ . Multiplicity result is established by combining sub and super method with variational techniques. This is joint work with S. Lorca and P. Ubilla. (Received February 12, 2008)
