# Gaussian Kinematic Formula and the integral geometry of random sets

Jonathan Taylor  
Stanford University

November 11, 2011

## Outline

- A model for random sets.
- Some *old* integral geometry.
- Gaussian integral geometry.
- Accuracy of approximation.

# Random sets

University

## Gaussian processes: basic building blocks

Twice-differentiable Gaussian process  $(f_t)_{t \in M}$  on a manifold  $M$ .

Satisfying:

- $\mathbb{E}\{f_t\} = 0$ ;
- $\mathbb{E}\{f_t^2\} = 1$ .

## Why Gaussian?

- Gaussian processes are specified by mean and covariance function.
- Finite-dimensional distributions are all simple – multivariate Gaussian.

Stanford  
University

## Excursion sets

Random sets we will consider are of the form:

$$f^{-1}A = \{t \in M : f_t \in A\}$$

for  $A \subset \mathbb{R}$ . In particular, the *geometry* of these sets, and how it is determined by correlation function of  $f$ .

## What geometric features?

We're interested in integral geometric properties.  
Specifically, the (expected) Euler characteristic

$$\mathbb{E} \{ \chi (f^{-1}[u, +\infty)) \} = \mathbb{E} \{ \chi (M \cap f^{-1}[u, +\infty)) \}$$

## EC tells you very little

Let  $M$  be a 2-manifold without boundary, then

$$\mathbb{E} \{ \chi (M \cap f^{-1}[0, +\infty)) \} = \frac{1}{2} \cdot \chi(M)$$

With boundary:

$$\mathbb{E} \{ \chi (M \cap f^{-1}[0, +\infty)) \} = \frac{1}{2} \cdot \chi(M) + \frac{1}{2\pi} \cdot |\partial M|$$

# Euler characteristic

Gaussian  
Kinematic  
Formula and  
the integral  
geometry of  
random sets

Jonathan  
Taylor  
Stanford  
University

## EC is computable

Of all quantities in the studies of Gaussian processes, the EC stands out as being *explicitly computable* in wide generality

$$\mathbb{E} \left\{ \chi \left( M \cap f^{-1}[u, +\infty) \right) \right\} = \sum_{j=0}^{\dim(M)} \mathcal{L}_j(M) \rho_j(u).$$

Where do  $\mathcal{L}_j$ 's and  $\rho_j$ 's come from?

## EC tells you a lot

For “nice enough”  $M$

$$\mathbb{E} \left\{ \chi \left( M \cap f^{-1}[u, +\infty) \right) \right\} \stackrel{u \rightarrow \infty}{\simeq} \mathbb{P} \left\{ \sup_{t \in M} f_t \geq u \right\}$$

# Euler characteristic

Gaussian  
Kinematic  
Formula and  
the integral  
geometry of  
random sets

Jonathan  
Taylor  
Stanford  
University

## Accuracy

- If the parameter set is *locally convex*, then

$$\left| \mathbb{P} \left\{ \sup_{t \in M} f_t \geq u \right\} - \mathbb{E} \left\{ \chi \left( M \cap f^{-1}[u, +\infty) \right) \right\} \right| \\ \stackrel{u \rightarrow \infty}{=} O_{\text{exp}} \left( e^{-u^2/2 \cdot \left(1 + \frac{1}{\sigma_c^2(f)}\right)} \right)$$

- Since,  $\rho_j(u) = O_{\text{exp}}(e^{-u^2/2})$ , the approximation has *exponential* relative accuracy!

# Integral geometry

Formula and  
the integral  
geometry of  
random sets

Jonathan  
Taylor  
Stanford  
University

## Tube formulae

- Suppose  $f$  is (the restriction to  $M$ ) of an isotropic process  $\tilde{f}$ , with  $\text{Var} \left\{ d\tilde{f}/dx_i \right\} = 1$ .
- For small  $r$ , the functionals  $\mathcal{L}_j(M)$  are implicitly defined by Steiner-Weyl formula

$$\mathcal{H}_k \left( x \in \mathbb{R}^k : d(x, M) \leq r \right) = \sum_{j=0}^k \omega_{k-j} r^{k-j} \mathcal{L}_j(M; M)$$

## Local convexity is important!

- Singularity means implicit definition is invalid, BUT  $\mathcal{L}_j(\cdot)$ 's are still well defined ...
- They are defined for a large class of sets ...

## Kinematic Fundamental Formula

- Considers the “average” curvature measures of  $M_1 \cap gM_2$ ,  
i.e.

# Integral geometry: KFF

Gaussian  
Kinematic  
Formula and  
the integral  
geometry of  
random sets

Jonathan  
Taylor  
Stanford  
University

## The KFF on $\mathbb{R}^N$

- Isometry group  $G_N$  of rigid motions of  $\mathbb{R}^N$ ,

$$G_N \sim \mathbb{R}^N \rtimes O(N)$$

- Fix a Haar measure:

$$\nu_N(\{g_N \in G_N : g_N x \in A\}) = \mathcal{H}_N(A)$$

- 

$$\begin{aligned} & \int_{G_N} \mathcal{L}_i(M_1 \cap g_N M_2) d\nu_N(g_N) \\ &= \sum_{j=0}^{N-i} \begin{bmatrix} i+j \\ i \end{bmatrix} \begin{bmatrix} N \\ j \end{bmatrix}^{-1} \mathcal{L}_{i+j}(M_1) \mathcal{L}_{N-j}(M_2) \end{aligned}$$

# Back to Gaussian processes

Gaussian  
Kinematic  
Formula and  
the integral  
geometry of  
random sets

Jonathan  
Taylor  
Stanford  
University

## Analogy with KFF

- Recall what we were trying to study

$$\begin{aligned} & \mathbb{E} \{ \chi (M \cap f^{-1}[u, +\infty)) \} \\ &= \int_{\Omega} \mathcal{L}_0(M \cap f(\omega)^{-1}[u, +\infty)) \mathbb{P}(d\omega) \\ &= \sum_{j=0}^{\dim(M)} \mathcal{L}_j(M) \rho_j(u) \end{aligned}$$

- This *looks like* KFF on  $\mathbb{R}^N$  where  $g_N M_2$  is replaced by  $f^{-1}[u, +\infty) = f^{-1}D$ .
- Can replace  $f$  with  $f = (f_1, \dots, f_j)$ . Let's look at some examples ...

## Gaussian Kinematic Formula

- Let  $f = (f_1, \dots, f_k)$  be made of IID copies of a Gaussian field
- Consider the additive functional on  $\mathbb{R}^k$  that takes a “rejection region”

$$D \mapsto \mathbb{E} \{ \chi(M \cap f^{-1}D) \}.$$

- **Questions:** how do the  $\mathcal{L}_j$ 's enter into this functional?  
How about  $D$ ?

# Gaussian processes

Gaussian

Formula and  
the integral  
geometry of  
random sets

Jonathan  
Taylor  
Stanford  
University

## Gaussian Kinematic Formula

- Define the functionals  $\mathcal{M}_j^{\gamma^k}(\cdot)$  implicitly by

$$\gamma_k \left( y \in \mathbb{R}^k : d(y, D) \leq r \right) = \sum_{j \geq 0} \frac{(2\pi)^{j/2} r^j}{j!} \mathcal{M}_j^{\gamma^k}(D).$$

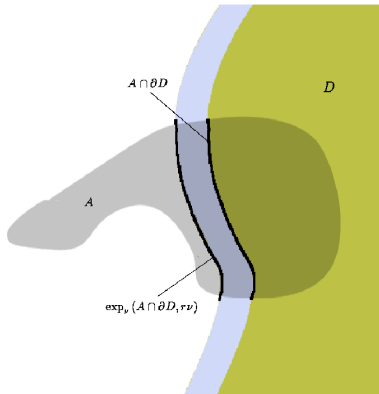

- Then:

$$\mathbb{E} \left\{ \chi(M \cap f^{-1}D) \right\} = \sum_j \mathcal{L}_j(M) \cdot \mathcal{M}_j^{\gamma^k}(D)$$

## EC densities

- Gaussian EC densities

$$\rho_j(u) = (-1)^j \frac{d^j}{du^j} \mathbb{P} \{N(0, 1) > u\}$$

- $\chi_k^2$  EC densities

$$\rho_{j, \chi_k^2}(u) = (-1)^j \frac{d^j}{dx^j} \mathbb{P} \left\{ \sqrt{\chi_k^2} > x \right\} \Big|_{x=\sqrt{u}}$$

## Hidden embedding

- A Gaussian process is just a mapping

$$t \mapsto f_t \in L^2(\Omega, \mathcal{F}, \mathbb{P})$$

- Our assumptions about mean and variance implies the image is in the unit sphere in  $L^2(\Omega, \mathcal{F}, \mathbb{P})$ , and it is an embedding.
- This suggests that the relevant “geometry” to prove this result is spherical.
- Short answer: *yes*.

# Proof: spherical KFF

Gaussian  
Kinematic  
Formula and  
the integral  
geometry of  
random sets

Jonathan  
Taylor  
Stanford  
University

## Spherical KFF

- For  $\kappa \in \mathbb{R}$  define

$$\mathcal{L}^\kappa(\cdot) = \sum_{n=0}^{\infty} \frac{(-\kappa)^n (i+2n)!}{(4\pi)^n n! i!} \mathcal{L}_{i+2n}(\cdot).$$

- For  $M_1, M_2 \subset S_{n^{1/2}}(\mathbb{R}^n)$

$$\begin{aligned} & \int_{G_n} \mathcal{L}_i^{n-1}(M_1 \cap g_n M_2) d\nu_{n,\lambda}(g_n) \\ &= \sum_{j=0}^{n-1-i} \begin{bmatrix} i+j \\ i \end{bmatrix} \begin{bmatrix} n-1 \\ j \end{bmatrix}^{-1} \mathcal{L}_{i+j}^{n-1}(M_1) \mathcal{L}_{n-1-j}^{n-1}(M_2) \end{aligned}$$

where  $G_n = O(n)$ , appropriately normalized.

# Proof: Poincaré's limit

Gaussian  
Kinematic  
Formula and  
the integral  
geometry of  
random sets

Jonathan  
Taylor  
Stanford  
University

## Model process

- For  $M \subset S(\mathbb{R}^j)$  define a  $\mathbb{R}^k$  valued process

$$f^n(t, g_n) = \pi_k(n^{1/2} g_n t)$$

where  $g_n \in O(n)$  is a Haar-distributed random matrix and  $\pi_k : S_{n^{1/2}}(\mathbb{R}^n) \rightarrow \mathbb{R}^k$  is projection onto the first  $k$  coordinates.

- Poincaré's limit (and generalizations) ensures that the process  $f^n = (f_1^n, \dots, f_k^n)$  converges in variation to a vector of IID zero mean, unit variance Gaussian processes  $f = (f_1, \dots, f_k)$ .

# Proof: connecting Gaussian processes with KFF

Gaussian  
Kinematic  
Formula and  
the integral  
geometry of  
random sets

Jonathan  
Taylor  
Stanford  
University

## Expected EC for model process

- For  $D \subset \mathbb{R}^k$

$$\begin{aligned} & \int_{G_n} \mathcal{L}_i^1(M \cap (f^n)^{-1}(D)) \, d\nu_{n,\lambda}(g_n) \\ &= n^{-i/2} \int_{G_n} \mathcal{L}_i^{n-1}(n^{1/2}M \cap \pi_k^{-1}D) \, d\nu_{n,\lambda}(g_n) \\ &= c_n \sum_{j=0}^{n-1-i} \begin{bmatrix} i+j \\ i \end{bmatrix} \begin{bmatrix} n-1 \\ j \end{bmatrix}^{-1} \mathcal{L}_{i+j}^1(M) \mathcal{L}_{n-1-j}^{n-1}(\pi_k^{-1}D) \end{aligned}$$

- The set  $\pi_k^{-1}D$  is the disjoint union of a warped product and  $D \cap S_{n^{1/2}}(\mathbb{R}^k)$ . Need to analyse curvatures of warped product asymptotically.
- The rest is combinatorics ... almost.
