Jane Gilman* (gilman@andromeda.rutgers.edu), Mathematics Department, Rutgers University, Newark, NJ. *A structure theorem for two-parabolic space*. Preliminary report.

Every non-elementary subgroup of $PSL(2, \mathbb{C})$ generated by two parabolic transformations is determined up to conjugacy by a non-zero complex number, λ and each $\lambda \neq 0$ determines a two-parabolic generator group. I will discuss a structure theorem for the space of all λ , that is, for the full representation space (modulo conjugacy) of non-elementary two-parabolic generator groups, including both the discrete and non-discrete groups.
