Given a Jordan curve  $J$ , the boundary of the convex hull of  $J$  in the 3-dimensional hyperbolic space consists of two disks bent along a pair  $(L^+, L^-)$  of geodesic measured laminations. I will discuss the injectivity of the map  $J \mapsto (L^+, L^-)$  and its image when restricted to a certain class of Jordan curves. (Received September 05, 2006)
