**Oksana Guba\*** (oksana@unm.edu), Department of Math, MSC03 2150, 1 University of New Mexico, Albuquerque, NM 87131. *Green's Functions on Large and Unbounded Intervals*. Preliminary report.

Many spectral problems are naturally posed on the infinite line. As an example, consider the linear operator  $Lu = a(x)u'' + b(x)u' + c(x)u$  and the spectral problem  $Lu = su$ . We assume that the spectral parameter  $s$  is in the resolvent of the operator  $L$  or its eigenvalue. For numerical purposes one typically restricts the problem to a finite interval introducing a boundary operator. We study the properties of Green's functions of all-line and bounded interval problems for different boundary operators. (Received July 10, 2007)
