Dana T Weston* (weston@math.missouri.edu), 120 Math Sciences Bldg, Department of Mathematics, University of Missouri, Columbia, MO 65211. *Examples of Some Henselian Rings.*

We provide an example of an analytically normal, local domain A such that for every positive integer n and every non-principal divisorial \widehat{A} -ideal \mathfrak{a} , the \widehat{A} -module $\bigoplus^n \mathfrak{a}$ does not descend to an A -module. (Received February 01, 2009)
