**Matthew B Day\*** ([mattday@caltech.edu](mailto:mattday@caltech.edu)), Department of Mathematics, Caltech, Pasadena, CA 91125. *Symplectic structures on right-angled Artin groups: between the mapping class group and the symplectic group.*

We define a family of groups that include the mapping class group of a genus  $g$  surface with one boundary component and the integral symplectic group  $\mathrm{Sp}(2g, \mathbb{Z})$ . We then prove that these groups are finitely generated. These groups, which we call mapping class groups over graphs, are indexed over labeled simplicial graphs with  $2g$  vertices. The mapping class group over the graph  $\Gamma$  is defined to be a subgroup of the automorphism group of the right-angled Artin group  $A_\Gamma$  of  $\Gamma$ . We also prove that the kernel of the map  $\mathrm{Aut} A_\Gamma$  to  $\mathrm{Aut} H_1(A_\Gamma)$  is finitely generated, generalizing a theorem of Magnus. (Received February 24, 2009)
