We start with the definition of Hamiltonian R -actions on symplectic orbifolds $[M/S]$, where R and S are tori. We show an injectivity theorem and generalize Tolman-Weitsman's proof of the GKM theorem in this setting. The main example is the symplectic reduction $X//S$ of a Hamiltonian T -manifold X by a subtorus S of T . This includes the class of symplectic toric orbifolds which are classified by labeled polytopes by Lerman. We apply our method to show that the equivariant cohomology ring of a symplectic toric orbifold is isomorphic over \mathbb{Z} to the Stanley-Reisner ring of the associated polytope. Furthermore, we define the equivariant Chen-Ruan cohomology ring and use the above results to establish a combinatorial method of computing this equivariant Chen-Ruan cohomology in terms of orbifold fixed point data.
