

## New and Noteworthy from Springer

**Mr Hopkins' Men:**  
Cambridge Reform and British Mathematics in the 19th Century  
A. D. D. Craik,  
University of St. Andrews, UK

This wide-ranging book tells the story of the remarkable William Hopkins and his top "wranglers", many of whom went on to have illustrious careers as bishops, judges, politicians, scientists or educators. It draws on first-hand accounts of life at Cambridge in the 19th century to give the reader a glimpse inside its colleges, and charts the evolution of the curriculum and the slow reforms that led to Cambridge's dominance of British higher education. As a special highlight, Hopkins' own collection of portraits of his top students are published - in full colour - for the first time.

**Modern Methods in the Calculus of Variations**  
*L<sup>p</sup> Spaces*

I. Fonseca, G. Leoni, both at Carnegie Mellon University, Pennsylvania

This is the first of two books on methods and techniques in the calculus of variations. Contemporary arguments are used throughout the text to streamline and present in a unified way classical results, and to provide novel contributions at the forefront of the theory.

This book addresses fundamental questions related to lower semicontinuity and relaxation of functionals within the unconstrained setting, mainly in  $L^p$  spaces. It prepares the ground for the second volume where the variational treatment of functionals involving fields and their derivatives will be undertaken within the framework of Sobolev spaces.

**More Math Into LaTeX, 4th Edition**

G. Grätzer, University of Manitoba, Winnipeg, MB, Canada

For nearly two decades **Math into LaTeX** has been the standard introductory text and complete reference for scientists in all disciplines and engineers. In this fourth edition, the reader is provided with important updates on articles and books; an important new topic is also discussed: how to create transparencies (computer projections) for classrooms and for professional meetings.

*There are several Latex guides, but this one wins hands down for the elegance of its approach and breadth of coverage.*

**Theory of Probability and Random Processes**

L. B. Koralov,

Y. G. Sinai, both at Princeton University, New Jersey

A one-year course in probability theory and the theory of random processes, taught at Princeton University to undergraduate and graduate students, forms the core of this book. It provides a comprehensive and self-contained exposition of classical probability theory and the theory of random processes. The book includes detailed discussion of Lebesgue integration, Markov chains, random walks, laws of large numbers, limit theorems, and their relation to Renormalization Group theory. It also includes the theory of stationary random processes, martingales, generalized random processes, and Brownian motion.

**The Arithmetic of Dynamical Systems**

J. Silverman, Brown University, Rhode Island

This book provides an introduction to the relatively new discipline of arithmetic dynamics. A principal theme of arithmetic dynamics is that many of the fundamental problems in the theory of Diophantine equations have dynamical analogs. This graduate-level text provides an entry for students into an active field of research and serves as a standard reference for researchers.

**Additive Number Theory**

**Density Theorems and the Growth of Sumsets**

M. B. Nathanson, City University of New York

**Additive Number Theory** presents material that deals with a central problem in additive number theory--the growth of sumsets. Ideas and techniques from many parts of mathematics including number theory, combinatorics, commutative algebra, ultrafilters and logic, and nonstandard analysis, are used to prove theorems in the subject. The book is self-contained, and provides short introductions to the various techniques that are not standard in this field.
