Nonlinear Partial Differential Equations

Asymptotic Behavior of Solutions and Self-Similar Solutions

MI-HO GIGA; YOSHIKAZU GIGA, *both Giga Laboratory, University of Tokyo, Japan*; JÜRGEN SAAL, *University of Konstanz, Germany*

This work will serve as an excellent first course in modern analysis. Key topics in nonlinear PDEs as well as several fundamental tools and methods are presented; few prerequisites are required of the reader. Challenging exercises, examples, and illustrations help explain the rigorous analytic basis for the Navier–Stokes equations, mean curvature flow equations, and other important equations describing real phenomena. The main focus of the text is on showing how self-similar solutions are useful in studying the behavior of solutions of nonlinear PDEs, especially those of parabolic type.

Spectral Methods in Surface Superconductivity

SØREN FOURNAIS, *University of Aarhus, Denmark*;
BERNARD HELFFER, *Université Paris-Sud and CNRS, France*

These two expert researchers in the field present a comprehensive treatment of key results concerning the Ginzburg–Landau (GL) functional. *Spectral Methods in Surface Superconductivity* examines in detail the two- and three-dimensional cases of the GL functional as they pertain to superconductivity. Also, instances of large GL parameter κ are covered, and a variety of exercises and open problems are discussed to further the reader's understanding of the material.

Fourier–Mukai and Nahm Transforms in Geometry and Mathematical Physics

CLAUDIO BARTOCCI, *Università degli Studi di Genova, Italy*; UGO BRUZZO, *SISSA, Trieste, Italy*; DANIEL HERNANDEZ RUIPEREZ, *Universidad de Salamanca, Spain*

This book examines the differential-geometric constructions of (Nahm) as well as the algebro-geometric approach to (Fourier–Mukai functors) transforms in geometry and math physics. Also included is a considerable amount of material scattered in the literature and not systematically organized in any existing textbook or monograph.

Number Theory

Structures, Examples, and Problems

TITU ANDREESCU, *The University of Texas at Dallas, Richardson, TX, USA*; DORIN ANDRICA, *'Babes-Bolyai' University, Cluj-Napoca, Romania*

This introductory textbook takes a problem-solving approach to number theory, situating each concept within the framework of an example or a problem for solving. Starting with the essentials, the text covers divisibility, unique factorization, modular arithmetic and the Chinese Remainder Theorem, Diophantine equations, binomial coefficients, Fermat and Mersenne primes and other special numbers, special sequences, and problems of density. Included are sections on mathematical induction and the pigeonhole principle, as well as a discussion of other number systems.

A Lost Mathematician, Takeo Nakasawa

The Forgotten Father of Matroid Theory

HIROKAZU NISHIMURA, *Tsukuba University, Japan*;
SUSUMU KURODA, *Passau, Germany* (Eds.)

Matroid theory was invented independently by two mathematicians in the 1930s, namely, Hassler Whitney in USA and Takeo Nakasawa in Japan. The former is well known, but unfortunately the latter had remained anonymous until a decade or two ago.

This book is structured in four parts: the first part consists of Nakasawa's four German papers and the second part contains their English translations. The third part is devoted to an explanation of Nakasawa's life and his times, and the fourth part deals with the comparison between the two fathers of matroid theory.

Stable Homotopy Around the Arf–Kervaire Invariant

VICTOR P. SNAITH, *University of Sheffield, UK*

This monograph describes important techniques of stable homotopy theory, both classical and new, applying them to the long-standing unsolved problem of the existence of framed manifolds with odd Arf–Kervaire invariant. Opening with an account of the necessary algebraic topology background, the book proceeds in a quasi-historical manner drawing from the author's contributions over several decades. A new technique entitled "upper triangular technology" is introduced, which enables the author to relate Adams operations to Steenrod operations and thereby to recover most of the important classical Arf–Kervaire invariant results. The final chapter briefly relates the book to the contemporary motivic stable homotopy theory of Morel–Voevodsky.

Representation Theory of Algebraic Groups and Quantum Groups

AKIHIKO GYOJA, *Nagoya University, Nagoya, Japan*;
HIRAKU NAKAJIMA, *Kyoto University, Kyoto, Japan*;
KEN-ICHI SHINODA, *Sophia University, Tokyo, Japan*;
TOSHIAKI SHOJI, *Nagoya University, Nagoya, Japan*;
TOSHIYUKI TANISAKI, *Osaka City University, Osaka, Japan* (Eds.)

This volume contains invited articles by top notch experts who focus on such topics as modular representations of algebraic groups, representations of quantum groups and crystal bases, representations of affine Lie algebras, representations of affine Hecke algebras, modular or ordinary representations of finite reductive groups, and representations of complex reflection groups and associated Hecke algebras.

Invited contributors include: H.H. Andersen; T. Arakawa; S. Ariki; J. Du; M. Geck; V. Ginzburg; J.C. Jantzen; S.J. Kang; M. Kashiwara; S. Kato; G.I. Lehrer; G. Lusztig; I. Mirkovic; H. Miyachi; H. Nakajima; T. Nakashima; R. Rouquier; D. Sagaki; Y. Saito; O. Schiffmann; T. Suzuki; T. Tanisaki; and J. Xiao.
