Explorations in Harmonic Analysis

with Applications to Complex Function Theory and the Heisenberg Group

Steven G. Krantz, Washington University, St. Louis, MO, USA

This self-contained text provides an introduction to modern harmonic analysis in the context in which it is actually applied, in particular, through complex function theory and partial differential equations. It takes the novice mathematical reader from the rudiments of harmonic analysis (Fourier series) to the Fourier transform, pseudo-differential operators, and finally to Heisenberg analysis. Within the textbook, the new ideas on the Heisenberg group are applied to the study of estimates for both the Szegő and Poisson–Szegő integrals on the unit ball in complex space.

APPLIED AND NUMERICAL HARMONIC ANALYSIS

Distributions

Theory and Applications

Johannes J. Duistermaat; Johan A.C. Kolk, Universiteit Utrecht, The Netherlands

This text is a concise, application-oriented introduction to the theory of distributions. It presents distributions as a natural method of analysis from both a mathematical and physical point of view. Methods are developed to justify many formal calculations that do not make sense in the classical framework. The discussion emphasizes applications to the general study of linear partial differential equations. The topics include an introduction to distributions, differentiation, convergence, and convolution of distributions, as well as Fourier transformations and spaces of distributions having special properties.

CORNERSTONES

Stochastic Models, Information Theory, and Lie Groups

Volume I: Classical Results and Geometric Methods

Gregory S. Chirikjian, The Johns Hopkins University, Baltimore, MD, USA

The subjects of stochastic processes, information theory, and Lie groups are usually treated separately from each other. This unique textbook presents these topics in a unified setting, thereby building bridges among fields that are rarely studied by the same individuals. Volume I establishes the geometric and statistical foundations required to understand the fundamentals of continuous-time stochastic processes, differential geometry, and the statistical branch of information theory.

APPLIED AND NUMERICAL HARMONIC ANALYSIS

Mathematics for Multimedia

M. Victor Wickerhauser, Washington University, St. Louis, MO, USA

This textbook presents the mathematics that is foundational to multimedia applications. Featuring a rigorous survey of selected results from algebra and analysis, the work examines tools used to create application software for multimedia signal processing and communication. Key features include over 100 exercises with complete solutions; many sample programs in Standard C and illustrations based on data from real studies; suggestions for further reading at the end of each chapter; and a companion website providing the computer programs described in the book as well as additional references and data files, such as images and sounds, to enhance the reader's understanding of key topics.

APPLIED AND NUMERICAL HARMONIC ANALYSIS

Families of Conformally Covariant Differential Operators, Q-Curvature and Holography

Andreas Juhl, Humboldt-Universität Berlin, Germany

This book studies structural properties of Q-curvature from an extrinsic point of view by regarding it as a derived quantity of certain conformally covariant families of differential operators which are associated to hypersurfaces. The new approach is at the cutting edge of central developments in conformal differential geometry in the last two decades (Fefferman–Graham ambient metrics, spectral theory on Poincaré–Einstein spaces, tractor calculus, Verma modules and Cartan geometry). The theory of conformally covariant families is inspired by the idea of holography in the AdS/CFT-duality. Among other things, it naturally leads to a holographic description of Q-curvature. The methods admit generalizations in various directions.

Nonlinear Partial Differential Equations

Asymptotic Behavior of Solutions and Self-Similar Solutions

Mi-Ho Giga; Yoshikazu Giga, both Giga Laboratory, University of Tokyo, Japan;
Jürgen Saal, University of Konstanz, Germany

This work will serve as an excellent first course in modern analysis. Key topics in nonlinear PDEs as well as several fundamental tools and methods are presented. Challenging exercises, examples, and illustrations help explain the rigorous analytic basis for the Navier–Stokes equations, mean curvature flow equations, and other important equations describing real phenomena.
