Inequalities

A Mathematical Olympiad Approach

Radmila Bulajich Manfrino, Universidad Autónoma del Estado de Morelos, Mexico; **José Antonio Gómez Ortega**, Universidad Nacional Autónoma de México; **Rogelio Valdez Delgado**, Universidad Autónoma del Estado de Morelos, Mexico

This book presents classical inequalities and specific inequalities which are particularly useful for tackling and solving optimization problems. Most of the examples, exercises and problems that appear in the book originate from Mathematical Olympiad contests around the world.

Fourier–Mukai and Nahm Transforms in Geometry and Mathematical Physics

Claudio Bartocci, Università degli Studi di Genova, Italy; **Ugo Bruzzo**, SISSA, Trieste, Italy; **Daniel Hernández Ruipérez**, Universidad de Salamanca, Spain

Integral transforms, such as the Laplace and Fourier transforms, have been major tools in mathematics for at least two centuries. In the last three decades the development of a number of novel ideas in algebraic geometry, category theory, gauge theory, and string theory has been closely related to generalizations of integral transforms of a more geometric character. *Fourier–Mukai and Nahm Transforms in Geometry and Mathematical Physics* examines the algebro-geometric approach (Fourier–Mukai functors) as well as the differential-geometric constructions (Nahm). Also included is a considerable amount of material from existing literature which has not been systematically organized into a monograph.

Applied Pseudoanalytic Function Theory

Vladislav V. Kravchenko, CINVESTAV, Querétaro, Mexico

Pseudoanalytic function theory generalizes and preserves many crucial features of complex analytic function theory. The Cauchy-Riemann system is replaced by a much more general first-order system with variable coefficients which turns out to be closely related to important equations of mathematical physics. This relation supplies powerful tools for studying and solving Schrödinger, Dirac, Maxwell, Klein-Gordon and other equations with the aid of complex-analytic methods. This book is dedicated to these recent developments in pseudoanalytic function theory and their applications as well as to multidimensional generalizations.

Pseudo-Differential Operators and Symmetries

Background Analysis and Advanced Topics

Michael Ruzhansky, Imperial College, London, UK; **Ville Turunen**, Helsinki University of Technology, Finland

This monograph develops a global quantization theory of pseudo-differential operators on compact Lie groups. Traditionally, the theory of pseudo-differential operators was introduced in the Euclidean setting with the aim of tackling a number of important problems in analysis and in the theory of partial differential equations. This also yields a local theory of pseudo-differential operators on manifolds. The present book takes a different approach by using global symmetries of the space which are often available.

A History of Algebraic and Differential Topology, 1900–1960

Jean Dieudonné

"This book is a well-informed and detailed analysis of the problems and development of algebraic topology, from Poincaré and Brouwer to Serre, Adams, and Thom. The author has examined each significant paper along this route and describes the steps and strategy of its proofs and its relation to other work. Previously, the history of the many technical developments of 20th-century mathematics had seemed to present insuperable obstacles to scholarship. This book demonstrates in the case of topology how these obstacles can be overcome, with enlightening results.... Within its chosen boundaries the coverage of this book is superb. Read it!"
