What Do the NAEP Math Tests Really Measure?

David Klein

The National Assessment of Educational Progress (NAEP)—often called the nation’s report card—includes math tests administered to representative populations of fourth- and eighth-grade students in each state. Widely cited by education researchers, the scores are used to track the progress (or lack thereof) of U.S. mathematics education, and they have appreciable influence on national education policies. Until recently, the past two decades have seen fourth- and eighth-grade NAEP math scores increase, albeit slowly. The National Council of Teachers of Mathematics claimed credit for the trend, pointing to its standards documents and policies, but scores were flat from 2007 to 2009. That prompted U.S. Education Secretary Arne Duncan to call for reforms to “accelerate achievement”. David Driscoll, chair of the National Assessment Governing Board of NAEP, argued that the lack of improvement demonstrated the need for better training of elementary school math teachers [1]. But what do the math NAEP tests actually measure?

Most problems from the NAEP exams are reused and are therefore kept secret. However, some items each year are retired and made available to the public. The National Center for Educational Statistics suggests that these released items can be used to “supplement classroom instruction” and “provide additional insight into the content of the assessment” [2]. Two of the algebra problems administered in 2009 are displayed in Figures 1 and 2.

8. Kiara set her beads on a table to make a repeating pattern. Some of the beads rolled off the table.

Here is what was left.

Which of the following should Kiara use to replace the missing beads in the pattern?

A. □□□□□
B. □□□□
C. □□□□
D. □□□

Figure 1. Grade 4 NAEP, 2009, Content Classification: Algebra.

Write the next two numbers in the number pattern.

1 6 4 9 7 12 10 ___ ___

Write the rule that you used to find the two numbers you wrote.

Figure 2. Grade 8 NAEP, 2009, Content Classification: Algebra.

The obvious lack of mathematical content in these items is unfortunately not limited to them. Algebra problems constitute 15% of the fourth-grade test and 30% of the eighth-grade test [3]. In
Overall, the prerequisites for the released NAEP math questions in all categories for fourth and eighth grades are minimal. Some questions test insignificant vocabulary only. Calculators are permitted on a substantial portion of the tests. The NMP Task Group on Assessment identified as "one of its greatest concerns" that "fractions (defined here as fractions, decimals, and related percent) are underrepresented on NAEP." Perhaps most importantly, many of the questions appear to be IQ items rather than math problems, in the sense that their solutions rely on almost no education or knowledge of mathematical techniques. This is especially the case for those questions that require students to complete a pattern or to fill in geometric shapes with other geometric shapes, like puzzles.

Indeed, NAEP scores have been used by psychologists for the purpose of estimating IQ, state by state [6]. That may be a more plausible use for these tests than their stated purpose, to measure mathematics achievement. In fact, a congressionally mandated report, more recent than the Task Group Assessment, concluded that "intended uses of NAEP assessment scores were not clearly defined." The report called for additional research into alignment between NAEP exams and state assessments based on academic content standards [7].

While it is true that some NAEP test questions do include rudimentary mathematical content, many others are as deficient as those displayed in Figures 1–4. What then do marginal differences in NAEP math scores between states really measure? Do they measure relative effectiveness of states' mathematics education programs, as is usually assumed, or do they measure differences in average IQ (whatever that might mean) of the residents? If it is primarily the latter, one would expect NAEP scores to show little if any increase even if school math instruction improved significantly.

The NAEP exam is widely regarded as the yardstick of mathematics achievement at the fourth- and eighth-grade levels in the United States. Diane Ravitch described one of its uses as follows [8].

NAEP monitors trends; if the state says its scores are rising but its scores on NAEP are flat, then the state reports are very likely inflated. In a choice between the state's self-reported scores and an audit test, the public should trust the audit test.

In the case of some states, the public should trust neither. Regardless of flaws in state assessments, to the extent that the NAEP is an IQ test, it is measuring something different from what state tests are designed to assess. Achievement is not the same as ability.
Until such time as a reliable national mathematics achievement test comes into existence, the plethora of education research articles that base their findings on NAEP math scores should be considered with reservations. More reliable, for the time being, are state-administered K–12 mathematics assessments directly tied to the content of credible state standards, as in the case of California.
