

## HILBERT NORMS FOR GRADED ALGEBRAS

JOACHIM KUPSCH AND OLEG G. SMOLYANOV

(Communicated by Dale Alspach)

ABSTRACT. This paper presents a solution to a problem from superanalysis about the existence of Hilbert-Banach superalgebras. Two main results are derived:

- 1) There exist Hilbert norms on some graded algebras (infinite-dimensional superalgebras included) with respect to which the multiplication is continuous.
- 2) Such norms cannot be chosen to be submultiplicative and equal to one on the unit of the algebra.

### 1. INTRODUCTION

The type of norms investigated in this article are generalizations of norms used for the symmetric tensor algebra in the white noise analysis [HKPS93], [KS93] or in the Malliavin calculus [Wat84]. But now more general algebras are included, especially the algebra of antisymmetric tensors (Grassmann algebra) and  $\mathbf{Z}_2$ -graded algebras (superalgebras) related to supersymmetry and to quantum probability [Mey93].

A locally convex commutative superalgebra is a  $\mathbf{Z}_2$ -graded locally convex space  $\mathcal{E} = \mathcal{E}_0 \oplus \mathcal{E}_1$  equipped with an associative continuous multiplication having the following property: for any  $a, b \in \mathcal{E}_0 \cup \mathcal{E}_1$ ,  $ab \neq 0$  the product satisfies  $ab = (-1)^{p(a)p(b)}ba$  with the parity function  $p$ , which is defined on  $(\mathcal{E}_0 \cup \mathcal{E}_1) \setminus \{0\}$  with  $p(\mathcal{E}_0 \setminus \{0\}) = 0$ ,  $p(\mathcal{E}_1 \setminus \{0\}) = 1$ , and  $p(ab) = |p(a) - p(b)|$ . Typical examples are Grassmann algebras with finite or countable sets of generators. In superanalysis one considers modules over (commutative) superalgebras [Rog80], [JP81], [DeW84], [VV85], [Rog86], [Ber87], [SS88], [Khr88].<sup>1</sup> It is quite easy to define an infinite-dimensional Grassmann algebra with a non-Hilbertian norm [Rog80]. But for a long time it was unknown whether the topology of a locally convex superalgebra—including the Grassmann algebra—can be defined with a Hilbert norm, and moreover, whether this norm can be chosen to be simultaneously submultiplicative and equal to one at the unit of the algebra. The paper gives a complete solution to these problems. Our theorems imply a positive answer to the first question and a negative answer to the second question.

<sup>1</sup>In the pioneering works of Martin [Mar59] and of Berezin [Ber66] the Grassmann algebra itself has been used instead of these modules.

## 2. GENERAL CONSIDERATIONS

Let  $\mathcal{A}$  be an algebra over the field  $\mathbf{K} = \mathbf{R}$  or  $\mathbf{C}$  with unit  $e_0$ . The product is denoted by  $a, b \in \mathcal{A} \rightarrow ab \in \mathcal{A}$ . We assume that  $\mathcal{A}$  is provided with a positive definite inner product  $a, b \in \mathcal{A} \rightarrow (a | b) \in \mathbf{K}$ . The corresponding Hilbert norm  $\|a\| = \sqrt{(a | a)} \geq 0$  is normalized at the unit  $\|e_0\| = 1$ . We are interested in such norms which allow a uniform estimate for the product of the algebra

$$(1) \quad \|ab\| \leq \gamma \|a\| \|b\|$$

with a constant  $\gamma \geq 1$ . In this section we prove under rather general conditions that this constant has the lower limit  $\gamma \geq \sqrt{\frac{4}{3}}$ .

**Theorem 1.** *Let  $\mathcal{A}$  be an algebra over the field  $\mathbf{K} = \mathbf{R}$  or  $\mathbf{C}$  with dimension  $\dim \mathcal{A} \geq 2$ . If this algebra satisfies the properties*

*i)  $\mathcal{A}$  is provided with a Hilbert inner product  $(. | .)$  normalized at the unit  $e_0$ ,  $\|e_0\|^2 = (e_0 | e_0) = 1$ ,*

*ii) there exists at least one element  $f \in \mathcal{A}, f \neq 0$ , such that  $e_0, f$  and  $f^2 = ff$  satisfy  $(e_0 | f) = (f | f^2) = 0$  and  $(e_0 | f^2) \geq 0$ ,*

*then the norm estimate  $\|ab\| \leq \gamma \|a\| \|b\|$  is not valid for some  $a, b \in \mathcal{A}$ , if  $\gamma < \sqrt{\frac{4}{3}}$ .*

*Proof.* Since  $f \neq 0$ , we can normalize this element and assume  $\|f\| = 1$ . Take  $a = e_0 + \lambda f$  with  $\lambda \in \mathbf{R}$ . Then  $a^2 = e_0 + 2\lambda f + \lambda^2 f^2$  and  $\|a^2\|^2 = 1 + 2\lambda^2 (e_0 | f^2) + 4\lambda^2 + \lambda^4 \|f^2\|^2 \geq 1 + 4\lambda^2$ . On the other hand  $\|a\|^2 = 1 + \lambda^2$ , and  $\|a^2\|^2 \leq \gamma^2 \|a\|^4$  implies  $1 + 4\lambda^2 \leq \gamma^2 (1 + \lambda^2)^2$ . But this inequality is true for all  $\lambda \geq 0$  only if  $\gamma^2 \geq \sup_{\lambda \geq 0} (1 + 4\lambda^2)(1 + \lambda^2)^{-2} = \frac{4}{3}$ .  $\square$

This theorem obviously applies to the tensor algebra  $\mathcal{T} = \bigoplus_{n=0}^{\infty} \mathcal{T}_n$ , where  $\mathcal{T}_n$  is the subspace of tensors of degree  $n$ , and the norm is defined in the standard way as

$$(2) \quad \|f\|^2 = \sum_{n=0}^{\infty} w_n \|f_n\|_n^2 \text{ if } f = \sum_{n=0}^{\infty} f_n, \quad f_n \in \mathcal{T}_n,$$

with arbitrary positive weights  $w_n > 0, n \in \mathbf{N}$  and  $w_0 = 1$ . In that case we can simply choose an element  $f \in \mathcal{T}_1, f \neq 0$ , to satisfy the assumptions with  $(e_0 | f \otimes f) = 0$ .

Theorem 1 can also be applied to a large class of algebras  $\mathcal{A}$  which can be derived from the tensor algebra  $\mathcal{T}$  by the following modifications of the product.

1. The product is generated by  $f, g \in \mathcal{A}_1 = \mathcal{T}_1 \rightarrow f \circ g := f \otimes g + (-1)^\chi g \otimes f$  where  $\chi = 0, 1 \pmod 2$  is a parity factor.
2. The product is generated by  $f, g \in \mathcal{A}_1 = \mathcal{T}_1 \rightarrow f \circ g := f \otimes g + (-1)^\chi g \otimes f + \omega(f, g)e_0$ . Here  $\chi$  is again a parity factor and  $\omega(., .) : \mathcal{A}_1 \times \mathcal{A}_1 \rightarrow \mathbf{K}$  is a bilinear pairing.

The first class of algebras includes the algebra of symmetric tensors, the algebra of antisymmetric tensors (Grassmann algebra), and tensor products of these algebras, including the  $\mathbf{Z}_2$ -graded algebras (superalgebras) used in quantum field theory. The assumptions of Theorem 1 are satisfied for any non-vanishing element  $f \in \mathcal{A}_1 = \mathcal{T}_1$ .

The second class includes the Clifford product, the (symmetric) Wiener product, the antisymmetric Wiener product (with antisymmetric  $\omega$ ) and Le Jan's supersymmetric Wiener-Grassmann product [Jan88], [Kup90], [Mey93]. In these cases the

assumptions of Theorem 1 are satisfied if there exists a non-vanishing  $f \in \mathcal{A}_1$  with  $\omega(f, f) \geq 0$ . Such a vector can always be found

- if the algebra is complex, or
- if the algebra is real and  $\omega$  is not negative definite.

The last constraint is satisfied for the symmetric Wiener product on real spaces, and for the real Clifford system in quantum field theory [BSZ92]. In both cases the form  $\omega$  is positive definite.

Moreover Theorem 1 is obviously true for any unital algebra  $\mathcal{A}$ , which has a nilpotent element  $f$  that is orthogonal to the unit element. If we only know that  $\mathcal{A}$  has at least one nilpotent element, we can derive the weaker

**Corollary 1.** *Let  $\mathcal{A}$  be an algebra which satisfies condition i) of Theorem 1. If this algebra has a nilpotent element  $f$ , then the norm estimate  $\|ab\| \leq \|a\| \|b\|$  is not valid for some  $a, b \in \mathcal{A}$ .*

*Proof.* We assume again  $\|f\| = 1$ . Then  $a = e_0 + \lambda f$  with  $\lambda \in \mathbf{R}$  and  $a^2 = (e_0 + \lambda f)^2 = e_0 + 2\lambda f$  have the norms  $\|a\|^2 = 1 + 2\lambda \text{Re}(e_0, f) + \lambda^2$  and  $\|a^2\|^2 = 1 + 4\lambda \text{Re}(e_0, f) + 4\lambda^2$ . If  $\text{Re}(e_0, f) = 0$ , we can apply the arguments given in the proof for Theorem 1. If  $\text{Re}(e_0, f) = \gamma \neq 0$ , then we choose  $\lambda = -2\gamma$ , and  $\|a^2\|^2 = 1 + 8\gamma^2 \leq 1 = \|a\|^4$  is a contradiction.  $\square$

### 3. NORM ESTIMATES FOR $\mathbf{Z}$ -GRADED ALGEBRAS

In this section we present Hilbert norm estimates for rather general  $\mathbf{Z}$ -graded algebras  $\mathcal{A}$  over the field  $\mathbf{K} = \mathbf{R}$  or  $\mathbf{C}$ . We assume the following structure of  $\mathcal{A}$ .

1. The algebra is the direct sum  $\mathcal{A} = \bigoplus_{n=0}^{\infty} \mathcal{A}_n$  of orthogonal spaces  $\mathcal{A}_n$ . Thereby  $\mathcal{A}_0$  is the one dimensional space  $\mathbf{K}$  spanned by the unit  $e_0$  of the algebra. The product  $a \circ b$  maps  $\mathcal{A}_p \times \mathcal{A}_q$  into  $\mathcal{A}_{p+q}$  for all  $p, q \in \{0, 1, \dots\}$ .
2. The spaces  $\mathcal{A}_n$  are provided with Hilbert norms  $\|\cdot\|_n, n = 0, 1, \dots$ . The unit has norm  $\|e_0\|_0 = 1$ . The product of two homogeneous elements  $a_p \in \mathcal{A}_p$  and  $b_q \in \mathcal{A}_q$  satisfies

$$(3) \quad \|a_p \circ b_q\|_{p+q} \leq \|a_p\|_p \|b_q\|_q$$

if  $a_p \in \mathcal{A}_p$  and  $b_q \in \mathcal{A}_q$ .

3. The algebra is provided with a family of Hilbert norms

$$(4) \quad \|a\|_{(\sigma)}^2 = \sum_{n=0}^{\infty} w_n(\sigma) \|a_n\|_n^2 \text{ if } a = \sum_{n=0}^{\infty} a_n, a_n \in \mathcal{A}_n$$

with  $\sigma \in \mathbf{R}$ . The factors  $w_n(\sigma), n = 0, 1, \dots$ , are positive weights with the normalization  $w_0(\sigma) = 1$  for all  $\sigma \in \mathbf{R}$ . The weights satisfy the inequalities  $w_n(\sigma) \leq w_n(\tau)$  for all  $n \in \mathbf{N}$  if  $\sigma \leq \tau$ .

An immediate consequence of these assumptions is  $\|a\|_{(\sigma)} \leq \|a\|_{(\tau)}$  for all  $a \in \mathcal{A}$  if  $\sigma \leq \tau$ . A simple example of such an algebra  $\mathcal{A}$  is the tensor algebra  $\mathcal{T}$ . Its standard norm satisfies (3) with weights  $w_n = 1$  for all  $n = 0, 1, \dots$ . More interesting examples are the algebras of symmetric tensors or of antisymmetric tensors. With the notation  $f \circ g$  for both the symmetric and the antisymmetric tensor product the estimate (3) is satisfied by the norms

$$(5) \quad \|f_1 \circ f_2 \circ \dots \circ f_n\|_n^2 = \begin{cases} (n!)^{-1} \text{per}(f_\mu | f_\nu) & \text{for symmetric tensors,} \\ (n!)^{-1} \det(f_\mu | f_\nu) & \text{for antisymmetric tensors,} \end{cases}$$

but it is violated if the factor  $(n!)^{-1}$  is omitted. The standard norm<sup>2</sup> is defined without the factor  $(n!)^{-1}$ . In the notations used here it corresponds therefore to a norm (4) with a weight function  $w_n = n!$ .

**Theorem 2.** *If there exists a constant  $\delta(\sigma, \tau, \rho) > 0$  such that the weight functions satisfy the inequalities*

$$(6) \quad (p + q - 1)w_{p+q}(\rho) \leq \delta(\sigma, \tau; \rho)w_p(\sigma)w_q(\tau) \text{ if } p, q \geq 1$$

for values of  $\sigma, \tau$  and  $\rho$  with  $\sigma \leq \rho$  and  $\tau \leq \rho$ , then the product of  $\mathcal{A}$  is estimated by

$$(7) \quad \|a \circ b\|_{(\rho)} \leq \gamma \cdot \|a\|_{(\sigma)} \|b\|_{(\tau)}$$

where the constant  $\gamma$  is  $\gamma = \sqrt{3} \max(1, \delta(\sigma, \tau, \rho))$ .

*Proof.* For  $a = a_0 + a_+$  and  $b = b_0 + b_+$  with  $a_0, b_0 \in \mathcal{A}_0 = \mathbf{K}$  and  $a_+ = \sum_{n=1}^\infty a_n$ ,  $b_+ = \sum_{n=1}^\infty b_n$  with  $a_n, b_n \in \mathcal{A}_n, n \in \mathbf{N}$ , the norm of  $a \circ b$  is calculated by

$$\begin{aligned} \|a \circ b\|_{(\rho)}^2 &= \|a_0 b_0 + a_0 b_+ + a_+ b_0 + a_+ \circ b_+\|_{(\rho)}^2 \\ &\leq |a_0 b_0|^2 + 3 \left( |a_0|^2 \|b_+\|_{(\rho)}^2 + \|a_+\|_{(\rho)}^2 |b_0|^2 + \|a_+ \circ b_+\|_{(\rho)}^2 \right) \\ &\leq |a_0 b_0|^2 + 3 \left( |a_0|^2 \|b_+\|_{(\rho)}^2 + \|a_+\|_{(\rho)}^2 |b_0|^2 + \sum_{n \geq 1} w_n(\rho) \left\| \sum'_{p+q=n} a_p \circ b_q \right\|_n^2 \right). \end{aligned}$$

The symbol  $\sum'$  means summation with the constraint  $p \geq 1, q \geq 1$ . The sum  $\sum_{p+q=n, p \geq 1, q \geq 1} \dots = \sum'_{p+q=n} \dots$  has  $n - 1$  terms; hence

$$\left\| \sum'_{p+q=n} a_p \circ b_q \right\|_n^2 \leq (n - 1) \sum'_{p+q=n} \|a_p \circ b_q\|_n^2 \stackrel{(3)}{\leq} (n - 1) \sum'_{p+q=n} \|a_p\|_p^2 \|b_q\|_q^2.$$

If  $w_n(\rho)$  is chosen such that (6) is satisfied, we obtain

$$\begin{aligned} \sum_{n \geq 1} w_n(\rho) \left\| \sum'_{p+q=n} a_p \circ b_q \right\|_n^2 \\ \leq \delta \cdot \left( \sum_{p \geq 1} w_p(\sigma) \|a_p\|_p^2 \right) \cdot \left( \sum_{q \geq 1} w_q(\tau) \|b_q\|_q^2 \right) \leq \delta \|a_+\|_{(\sigma)}^2 \|b_+\|_{(\tau)}^2. \end{aligned}$$

For  $\rho \leq \sigma, \tau$  we have in addition the inequalities  $\|a_+\|_{(\rho)}^2 \leq \|a_+\|_{(\sigma)}^2$  and  $\|b_+\|_{(\rho)}^2 \leq \|b_+\|_{(\tau)}^2$  such that finally

$$\begin{aligned} \|a \circ b\|_{(\rho)}^2 &\leq |a_0 b_0|^2 + 3 \left( |a_0|^2 \|b_+\|_{(\tau)}^2 + \|a_+\|_{(\sigma)}^2 |b_0|^2 + \delta \|a_+\|_{(\sigma)}^2 \|b_+\|_{(\tau)}^2 \right) \\ &\leq 3\gamma \|a\|_{(\sigma)}^2 \|b\|_{(\tau)}^2, \end{aligned}$$

where  $\gamma$  is  $\gamma = \max(1, \delta)$ . □

---

<sup>2</sup>The “standard” inner product of the symmetric/antisymmetric tensor algebra is characterized by the following property. Let  $\mathcal{F}_i, i = 1, 2$ , be two orthogonal subspaces of the space  $\mathcal{A}_1$ . Denote by  $\mathcal{A}(\mathcal{F}_i)$  the subalgebra generated by elements  $f \in \mathcal{F}_i$ . Then  $(a_1 \circ a_2 \mid b_1 \circ b_2) = (a_1 \mid b_1) (a_2 \mid b_2)$  holds for all  $a_i \in \mathcal{A}(\mathcal{F}_i), i = 1, 2$ .

As the first application of Theorem 2 we derive norms with respect to which the product of the algebra is continuous. In that case the inequality (6) has to be satisfied for identical weights  $w_p(\sigma) = w_p(\tau) = w_p(\rho) = w_p$ ,  $p \geq 1$ . If we fix  $q = 1$ , then (6) implies  $p \cdot w_{p+1} \leq \delta \cdot w_p \cdot w_1$  for  $p \in \mathbf{N}$ . As a consequence we obtain  $w_p \leq \delta^{p-1} ((p-1)!)^{-1} w_1$ ,  $p \geq 1$ . The slowest decrease of the weights which might be possible according to our estimates is therefore  $w_p \sim ((p-1)!)^{-1}$ . The proof that such a solution actually exists follows from the simple estimate  $(m+n)! \geq m!n!$  if  $m, n \geq 0$ . Hence  $(p+q-1) \frac{1}{(p+q-1)!} = \frac{1}{(p+q-2)!} \leq \frac{1}{(p-1)!} \frac{1}{(q-1)!}$  is valid for all  $p, q \geq 1$ . Since

$$(8) \quad 2^{m+n} \geq \binom{m+n}{m} = \frac{(m+n)!}{m!n!} \geq m+n \text{ if } m, n \geq 1,$$

also  $(p+q-1) \frac{1}{(p+q)!} < \frac{1}{(p+q-1)!} \leq \frac{1}{p!} \frac{1}{q!}$  follows for all  $p, q \geq 1$ . We have therefore derived

**Corollary 2.** *If the norm is defined with the weights  $w_0 = 1$ ,  $w_n = ((n-1)!)^{-1}$ ,  $n \geq 1$ , or with  $w_0 = 1, w_n = (n!)^{-1}$ ,  $n \geq 1$ , the product of the algebra is continuous with the uniform norm estimate*

$$(9) \quad \|a \circ b\| \leq \sqrt{3} \|a\| \|b\|.$$

As a more general class of norms we choose weights

$$(10) \quad w_0 = 1, w_n(\sigma, \rho, s) = (n!)^\sigma 2^{\rho n} (1+n)^s \text{ if } n \geq 1,$$

with real parameters  $\sigma, \rho, s$ . These weights satisfy the inequalities  $w_n(\sigma_1, \rho_1, s_1) \leq w_n(\sigma_2, \rho_2, s_2)$  if  $\sigma_1 \leq \sigma_2, \rho_1 \leq \rho_2, s_1 \leq s_2$ . We denote by  $\|a\|_{(\sigma, \rho, s)}$  the norm (4) defined with the weights  $w_n(\sigma, \rho, s)$ . The estimate (8) and the bounds  $\frac{(m+n)!}{m!n!} \geq \frac{(2m)!}{(m!)^2} \geq \text{const} \cdot 2^{2m} m^{-\frac{1}{2}}$  if  $n \geq m \geq 1$  and  $1 \leq \frac{(1+m)(1+n)}{1+m+n} \leq 1 + \min(m, n)$  yield inequalities of the type (6) also for these norms. We obtain

$$(11) \quad (p+q-1)w_{p+q}(\sigma, \rho, s) \leq \delta w_p(\sigma', \rho', s') w_q(\sigma', \rho', s') \text{ if } p, q \geq 1$$

with a constant  $\delta \geq 1$  if  $\sigma = \sigma' = -1$  with  $\rho = \rho' \in \mathbf{R}$  and  $s = s' \leq 0$ , or if  $\sigma = \sigma' < -1$  with  $\rho = \rho' \in \mathbf{R}$  and  $s = s' \in \mathbf{R}$ .

The generalizations of (9) are therefore

$$(12) \quad \|a \circ b\|_{(-1, \rho, s)} \leq \sqrt{3} \|a\|_{(-1, \rho, s)} \cdot \|b\|_{(-1, \rho, s)} \text{ if } \rho \in \mathbf{R}, s \leq 0,$$

and

$$(13) \quad \|a \circ b\|_{(\sigma, \rho, s)} \leq \gamma \|a\|_{(\sigma, \rho, s)} \cdot \|b\|_{(\sigma, \rho, s)} \text{ if } \sigma < -1, \rho \in \mathbf{R}, s \in \mathbf{R}.$$

Here  $\gamma$  takes some value  $\gamma \geq \sqrt{3}$  depending on the choice of the parameters  $\sigma$  and  $s$ .

Moreover, the inequalities (11) are valid for  $(\sigma, \rho, s) \neq (\sigma', \rho', s')$  if  $\sigma < \sigma'$  or if  $\sigma = \sigma'$  and  $\rho < \rho'$ . The corresponding estimates for the norms are

$$(14) \quad \|a \circ b\|_{(\sigma, \rho, s)} \leq \gamma \|a\|_{(\sigma', \rho', s')} \cdot \|b\|_{(\sigma', \rho', s')} \text{ if } \sigma < \sigma' \text{ for all } \rho, \rho', s, s' \in \mathbf{R},$$

and

$$(15) \quad \|a \circ b\|_{(\sigma, \rho, s)} \leq \gamma \|a\|_{(\sigma, \rho', s')} \cdot \|b\|_{(\sigma, \rho', s')} \text{ if } \rho < \rho' \text{ for all } \sigma, s, s' \in \mathbf{R}.$$

The value of  $\gamma \geq \sqrt{3}$  depends on the choice of the parameters.

For the tensor algebra and for algebras of symmetrized tensors<sup>3</sup> the Hilbert space  $\mathcal{A}_1 = \mathcal{H}$  generates the whole algebra. Given a (self-adjoint/positive) operator  $A$  on  $\mathcal{H}$ , the mapping  $\Gamma(A)e_0 = e_0$  and  $\Gamma(A)(f_1 \circ f_2 \circ \dots \circ f_n) := (Af_1) \circ (Af_2) \circ \dots \circ (Af_n)$  for  $f_\mu \in \mathcal{H}$ ,  $\mu = 1, \dots, n$ , and  $n \in \mathbf{N}$ , defines a unique (self-adjoint/positive) operator  $\Gamma(A)$  on the algebra  $\mathcal{A}$ , which satisfies the relation

$$(16) \quad \Gamma(A)(a \circ b) = (\Gamma(A)a) \circ (\Gamma(A)b).$$

The norms (4) with the weights (10) are then easily generalized to

$$(17) \quad \|a\|_{(\sigma, \rho, s)}^2 = \sum_{n=0}^{\infty} (n!)^\sigma \|(\Gamma(A))^\rho a_n\|_n^2 (1+n)^s \text{ if } a = \sum_{n=0}^{\infty} a_n, a_n \in \mathcal{A}_n.$$

If  $A$  is an invertible positive operator with lower bound  $A \geq 2 \cdot id$ , then  $\Gamma(A)$  satisfies  $\|(\Gamma(A))^{-\rho} a\|_n \leq 2^{-n\rho} \|a\|_n$  for  $a \in \mathcal{A}_n$  if  $\rho \geq 0$ . This bound and the relation (16) imply that the estimates (12), (13) and (15) are also valid for the norms (17); moreover (14) holds if  $\rho \leq \rho'$ .

If  $A^{-1}$  is a Hilbert-Schmidt operator, then a family of norms (17) can be used to define a nuclear topology on the algebra  $\mathcal{A}$ . For the symmetric tensor algebra that has been done in the white noise calculus and in the Malliavin calculus, see e.g. [AM93], [KS93], [Wat84]. For the algebra of antisymmetric tensors and for the superalgebras such nuclear topologies can be found in [Kr e78] and in [HK95]. But the estimates of these references are not strong enough to derive the results with a single Hilbert norm as presented in Corollary 2 and in equations (12) and (13).

<sup>3</sup>This class of algebras does not only include the algebra of symmetric tensors and the algebra of antisymmetric tensors (Grassmann algebra), but also the  $\mathbf{Z}_2$ -graded algebras (superalgebras) used in supersymmetric quantum field theory.
