QUARTERLY OF APPLIED MATHEMATICS

This periodical is published quarterly under the sponsorship of Brown University, Providence, R. I. For its support, an operational fund is being set up to which industrial organizations may contribute. To date, contributions of the following industrial companies are gratefully acknowledged:

BELL TELEPHONE LABORATORIES, INC.; NEW YORK, N. Y.,
THE BRISTOL COMPANY; WATERBURY, CONN.,
CURTISS WRIGHT CORPORATION; AIRPLANE DIVISION; BUFFALO, N. Y.,
EASTMAN KODAK COMPANY; ROCHESTER, N. Y.,
GENERAL ELECTRIC COMPANY; SCHENECTADY, N. Y.,
GULF RESEARCH AND DEVELOPMENT COMPANY; PITTSBURGH, PA.,
LEEDS & NORTHRUP COMPANY; PHILADELPHIA, PA.,
PRATT & WHITNEY, DIVISION NILES-BEMENT-POND COMPANY; WEST HARTFORD, CONN.,
REPUBLIC AVIATION CORPORATION; FARMINGDALE, LONG ISLAND, N. Y.,
UNITED AIRCRAFT CORPORATION; EAST HARTFORD, CONN.,
WESTINGHOUSE ELECTRIC AND MANUFACTURING COMPANY; PITTSBURGH, PA.

The QUARTERLY prints original papers in applied mathematics which have an intimate connection with application in industry or practical science. It is expected that each paper will be of a high scientific standard; that the presentation will be of such character that the paper can be easily read by those to whom it would be of interest; and that the mathematical argument, judged by the standard of the field of application, will be of an advanced character.

Manuscripts submitted for publication in the QUARTERLY OF APPLIED MATHEMATICS should be sent to the Managing Editor, Professor W. Prager, Quarterly of Applied Mathematics, Brown University, Providence 12, R. I., either directly or through any one of the Editors or Collaborators. In accordance with their general policy, the Editors welcome particularly contributions which will be of interest both to mathematicians and to engineers. Authors will receive galley proofs only. The authors' institutions will be requested to pay a publication charge of \$5.00 per page which, if honored, entitles them to 100 free reprints. Instructions will be sent with galley proofs.

The subscription price for the QUARTERLY is \$6.00 per volume (April-January), single copies \$2.00. Subscriptions and orders for single copies may be addressed to: Quarterly of Applied Mathematics, Brown University, Providence 12, R. I., or to Box 2-W, Richmond, Va.

Entered as second class matter March 14, 1944, at the post office at Providence, Rhode Island, under the act of March 3, 1879. Additional entry at Richmond, Virginia.

3 books in the **WILEY APPLIED MATHEMATICS SERIES**

Edited by I. S. Sokolnikoff

TENSOR ANALYSIS

Theory and Applications.

By I. S. SOKOLNIKOFF, *University of California at Los Angeles*. This is the first book to develop tensor theory without specific reference to any field of application, which results in a remarkable economy of space and thought in producing special results. After the theory is developed the author applies it to Geometry, Analytical Mechanics, Relativity, Elasticity, and Fluid Mechanics. *October. 335 pages. \$6.00.*

FINITE DEFORMATION OF AN ELASTIC SOLID

By FRANCIS D. MURNAGHAN, *Instituto Tecnológico de Aeronautica, Brazil*. The distinguishing feature of this book is its consideration of squares and higher powers of the strain components in the theory of elasticity, with the result that the theory can be applied to larger deformations and stresses than those allowed by the classical theory. *November. 140 pages. \$4.00.*

THEORY OF PERFECTLY PLASTIC SOLIDS

By WILLIAM PRAGER, *Brown University*, and PHILIP G. HODGE, JR., *University of California at Los Angeles*. The first book to present an intermediate treatment of the mathematical theory of perfectly plastic solids, a branch of the general theory in which numerous results of practical importance to the designer are now available or within reach. Recent important results in limit analysis are published for the first time. *1951. 264 pages. \$5.50.*

Quantum Mechanics of Particles and Wave Fields

By ARTHUR MARCH, *University of Innsbruck, Austria*. . . . 1951. 292 pages. \$5.50.

Statistical Methodology Reviews, 1941-1950

By OSCAR KRISSEN BUROS, *Rutgers University*. . . . 1951. 457 pages. \$7.00.

Linear Computations

By PAUL S. DWYER, *University of Michigan*. One of the Wiley Publications in Statistics, Walter A. Shewhart, Editor. 1951. 344 pages. \$6.50.

Index Numbers

By BRUCE D. MUDGETT, *University of Minnesota*. One of the Wiley Publications in Statistics, Walter A. Shewhart, Editor. 1951. 135 pages. \$3.00.

New McGraw-Hill Books

ASTROPHYSICS: A Topical Symposium

Edited by J. A. HYNEK, Ohio State University. *McGraw-Hill Astronomical Series*. 703 pages, \$12.00

A symposium of papers treating "essentially all the active fields" of astrophysics. The fifteen contributors are leaders and authorities in their respective fields. The volume commemorates the Fiftieth Anniversary of the Yerkes Observatory and reviews the progress in astrophysics during the half-century since the founding of the observatory. The book combines many of the features of a textbook, a handbook, a historical study, and a technical treatise.

CONFORMAL MAPPING

By ZEEV NEHARI, Washington University. *International Series in Pure and Applied Mathematics*. Ready in February

Bridges the gap between the theoretical approach of the pure mathematician and the more practical interests of the engineer, physicist, and applied mathematician concerned with the actual construction of conformal maps. A large number of problems and exercises are included for students.

DIFFERENTIAL EQUATIONS

By WALTER LEIGHTON, Washington University. *International Series in Pure and Applied Mathematics*. In press

A unified treatment which is built around the fundamental existence theorem as a central idea and one which becomes part of the student's experience. While the proof is given in the appendix, its use and understanding are emphasized in the text, which covers the usual material given in a first course but with unusual attention devoted to underlying theory.

5. Conclusions

By using an expansion of the type (2.1) of the determinantal frequency equation (1.3), obtained for ordinary mechanical systems with n degrees of freedom, it is easy to obtain approximate expressions (3.1), supposing "weak coupling" and distinct eigenvalues. By examples it is shown, that similar developments of the eigenvalues as (3.1) will hold also in cases, where at least some of the terms in the principal diagonal of the matrix are of the same order as the coupling terms.

BOOK REVIEWS

Electromagnetic problems of microwave theory. By H. Motz. Methuen & Co. Ltd., London, and John Wiley & Sons, Inc., New York, 1951. vii + 184 pp. \$2.00.

This book is a new Methuen Monograph dealing in Chapter one with a summary of general topics in microwave methods including velocity modulated tubes, travelling wave tubes, resonators, cavity magnetrons, methods of detection, wavemeters, standing wave meters, the Smith chart, and matching. Chapters two and three deal with a detailed discussion of velocity modulation and Klystron theory following the work of Webster. Chapter four is entitled Mode Selection in Cavity Magnetrons and includes the Fourier Analysis of the rotating waves and conditions for synchronism of the electrons with the rotating field components. Some discussion of mode stability is given together with an estimate of magnetron efficiency.

Chapter five discusses the field relations in wave guides in orthogonal curvilinear systems. Application is made to guides of rectangular and circular cross section. The use of series expansions in terms of normal mode solutions is illustrated. The transmission line analogy is discussed briefly.

Calculation of electromagnetic fields in cavities and guides of complex shape is discussed in some detail in chapter six where relaxation and finite difference methods are used. The methods are illustrated with resonator gaps. The determination of the field pattern for higher modes is also discussed briefly. The analytical treatment of corrugated wave guides, as done by Wilkinshaw, is outlined very well in the space of about six pages.

Chapter seven is concerned with the impedance of an antenna in a wave guide. The problem of coupling into wave guides by means of straight wires or loops, as treated by the Toronto group, is presented in a very satisfactory way. The theory of discontinuities in wave guides as worked out by Bethe and Schwinger is outlined and applied to transverse windows, changes in cross section, and bends. The methods are applicable only to thin windows and sudden changes in cross section but a numerical method, applicable to any type of discontinuity, is outlined.

A large amount of useful material is packed into the 180 pages that make up this monograph. The writer did a very good job of discussing the problems which he includes. A person actively working in microwave theory will probably find this book useful as well as the person looking for general information.

ROHN TRUELL

Ordinary non-linear differential equations in engineering and physical sciences. By N. W. McLachlan. Oxford at the Clarendon Press, 1950. vi + 201 pp. \$4.25.

The contents of this book are of essentially two categories. Following a general introduction, the second chapter deals with examples of non-linear equations which can be integrated explicitly. The third chapter is concerned with the particular situation where the explicit integration requires the use of elliptic functions. The remainder of the book deals with the second category, i.e., the non-linear equations which arise in vibration problems.

In chapter four, the Van der Pol equation with small parameter, and the non-linear restoring force problem, are treated in detail. Emphasis is given to the physical phenomena involved as well as to the mathematical solutions. The relaxation oscillations of the Van der Pol equation are discussed very briefly. The method of slowly varying amplitude and phase and the equivalent linear equation are discussed in chapters five and six. Chapter seven is devoted to equations with periodic coefficients and chapter eight to numerical and graphical methods of solutions. Almost every equation in the book is illustrated by a physical problem so that the book should be of considerable interest to engineers.

G. F. CARRIER

Integraltafel. Zweiter Teil: Bestimmte Integrale. By Wolfgang Gröbner and Nikolaus Hofreiter. Springer-Verlag, Wien and Innsbruck, 1950. vi + 551 pp. \$5.80.

This very complete table of definite integrals is a companion volume to *Integraltafel (Unbestimmte Integrale)* of indefinite integrals by the same authors, published in 1949 (reviewed QAM, January 1950). This book contains approximately two thousand definite integrals including some which are not found in Bierens de Haan. The symbols are large and clear and the general make-up of the table is very satisfactory. The only change that this reviewer would ask for is specification of the limits of integration in the table of contents. The table of contents is as follows: Symbols and Notation, Methods of Calculating Definite Integrals, General Integral Formulae. (1) Rational Integrands (detailed listing omitted). Orthogonal Polynomials, including Legendre, Hypergeometric, Tschebyscheff, Associated Legendre, Laguerre and Hermite Polynomials (detailed listing omitted). (2) Algebraic Irrational Integrands, including elliptic integrals of Legendre and Weierstrass Canonical forms (detailed listing omitted). (3) Elementary Transcendental Integrands. Integrands of the form $R(\exp \lambda x, \exp \mu x, \dots)$, $[\exp(-sx)]f(x)$, $R(x, \exp \lambda x)$, $R(x, \exp f(x))$, $f(\log x)$, $\log[g(x)]$, Euler Dilogarithm, $f(x)(\log x)^n$ with $f(x)$ rational, irrational and transcendental, $f(x) \log[g(x)]$, $F[x, \log f(x)]$, (exponential, logarithmic, sine and cosine integrals), $f(\sin x, \cos x)$, $f(\sin ax, \cos bx, \dots)$, $F[x, \sin ax, \cos bx]$, $F[x, \sin f(x), \cos g(x), \dots]$, $F[\exp ax, \sin bx, \cos cx]$, $F[x, \exp ax, \sin bx, \cos cx]$, $F[x, \exp f(x), \sin g(x), \cos h(x)]$, $F[x, \log f(x), \sin g(x), \cos h(x)]$, $F[x, \arcsin x, \arccos x]$, $F[x, \arctan x, \operatorname{arccot} x]$, $R[\exp \lambda x, \sinh ax, \cosh bx]$, $R[x, \sinh ax, \cosh bx]$, $F[f(x), \sinh ax, \cosh bx]$. Integrals of $\sinh^{-1} x$, $\cosh^{-1} x$, $\tanh^{-1} x$, $\operatorname{coth}^{-1} x$. (4) Euler Integrals. Gamma function, Beta function, products of powers of linear expressions with general exponents, products of powers of binomial expressions with general exponents, products of powers of higher order expressions with general exponents. (5) Integrals of Cylinder functions. Bessel functions, Bessel functions with imaginary arguments, Integrals of the form $F[x, Z_n(x)]$, $F[x, \exp x, \log x, Z_n(x)]$, $F[x, \sin x, \cos x, Z_n(x)]$, $F[x, Z_n(x), Z_\mu(x)]$.
