

NOTE ON A PAPER BY MANDELBROJT AND MacLANE

BY
JACQUELINE FERRAND

The results obtained by J. Dufresnoy and J. Ferrand⁽¹⁾ enable us to extend Theorems I, II, and III of the preceding paper to more general strip regions.

Let $g_i(\sigma) > 0$ ($i=1, 2$) be defined and continuous for $\sigma \geq a$ ($-\infty \leq a < \infty$) with $\lim_{\sigma \rightarrow \infty} g_i(\sigma) = \pi/2$. Let

$$S(\sigma) = \pi \int_a^\sigma \frac{du}{g_1(u) + g_2(u)}.$$

Let Δ_s be the domain in the s -plane ($s = \sigma + it$) defined by $-g_1(\sigma) < t < g_2(\sigma)$.

If $g_1(\sigma) = g_2(\sigma)$ we have the symmetrical domain considered above.

Lemmas I, II, III, and IV are true for the new domain if we suppose that $g_1(\sigma)$ and $g_2(\sigma)$ separately satisfy all the conditions given for $g(\sigma)$: $g_1(\sigma)$ and $g_2(\sigma)$ must be of bounded variation⁽²⁾ and satisfy the condition (11), $|g'_i(\sigma)| < A$, $g'_i(\sigma+h) - g'_i(\sigma) > -Ah$. The proofs of Theorems I, II, and III are the same, with the new function $S(\sigma)$.

⁽²⁾ In fact the conclusions hold if this first condition is replaced by $\int_a^\infty |g'_i(\sigma)|^2 d\sigma < \infty$.
