Michael Hull* (mhull@uncg.edu). *Maps between 3-manifolds*. Preliminary report.

We study the maps between compact 3-manifolds by considering the induced homomorphisms between fundamental groups. We prove that sets of homomorphisms to 3-manifold groups satisfy a group-theoretic analogue of the Hilbert Basis Theorem, answering a question of Agol-Liu. We apply this theorem to give a descending chain condition on π_1 -surjective maps between compact 3-manifolds, answering a question of Reid-Wang-Zhou. This is joint work with D. Groves and H. Liang.
