Virginia Tech, 225 Stranger Street, Blacksburg, VA 24061. *Properties of Expander
Codes*. Preliminary report.

Expander codes were introduced by Sipser and Spielman in 1996. Spielman later showed that they were used to give an asymptotically good family of error-correcting codes that can be decoded in linear time even from a constant fraction of errors in a received word. The codes are a special type of LDPC code formed using a (c, d) expander graph $G = (L \dot{\cup} R, E)$ and inner codes of length d over a finite field \mathbb{F} . The properties of the expander code depend on those of the underlying expander graph as well as the inner code. In this talk we will discuss some properties of expander codes.
