Preface xi

Chapter 1. Introduction 1
  1.1. An overview 1  
  1.2. Plan of the book 6

Part 1. \(J\)-Convexity 9

Chapter 2. \(J\)-Convex Functions and Hypersurfaces 11  
  2.1. Linear algebra 11  
  2.2. \(J\)-convex functions 13  
  2.3. The Levi form of a hypersurface 15  
  2.4. Completeness 18  
  2.5. \(J\)-convexity and geometric convexity 19  
  2.6. Normalized Levi form and mean normal curvature 20  
  2.7. Examples of \(J\)-convex functions and hypersurfaces 22  
  2.8. Symplectic properties of \(J\)-convex functions 25  
  2.9. Computations in \(\mathbb{C}^n\) 27

Chapter 3. Smoothing 31  
  3.1. \(J\)-convexity and plurisubharmonicity 31  
  3.2. Smoothing of \(J\)-convex functions 34  
  3.3. Critical points of \(J\)-convex functions 37  
  3.4. From families of hypersurfaces to \(J\)-convex functions 40  
  3.5. \(J\)-convex functions near totally real submanifolds 42  
  3.6. Functions with \(J\)-convex level sets 48  
  3.7. Normalized modulus of \(J\)-convexity 50

Chapter 4. Shapes for \(i\)-Convex Hypersurfaces 57  
  4.1. Main models 57  
  4.2. Shapes for \(i\)-convex hypersurfaces 59  
  4.3. Properties of \(i\)-convex shapes 64  
  4.4. Shapes in the subcritical case 67  
  4.5. Construction of special shapes 68  
  4.6. Families of special shapes 75  
  4.7. Convexity estimates 83

Chapter 5. Some Complex Analysis 89  
  5.1. Holomorphic convexity 89  
  5.2. Relation to \(J\)-convexity 90  
  5.3. Definitions of Stein manifolds 93
5.4. Hartogs phenomena 94
5.5. Grauert’s Oka principle 96
5.6. Coherent analytic sheaves on Stein manifolds 99
5.7. Real analytic manifolds 101
5.8. Real analytic approximations 104
5.9. Approximately holomorphic extension of maps from totally real submanifolds 107
5.10. CR structures 108

Part 2. Existence of Stein Structures 113

Chapter 6. Symplectic and Contact Preliminaries 115
6.1. Symplectic vector spaces 115
6.2. Symplectic vector bundles 117
6.3. Symplectic manifolds 118
6.4. Moser’s trick and symplectic normal forms 119
6.5. Contact manifolds and their Legendrian submanifolds 122
6.6. Contact normal forms 125
6.7. Real analytic approximations of isotropic submanifolds 127
6.8. Relations between symplectic and contact manifolds 128

Chapter 7. The $h$-principles 131
7.1. Immersions and embeddings 131
7.2. The $h$-principle for isotropic immersions 135
7.3. The $h$-principle for subcritical isotropic embeddings 136
7.4. Stabilization of Legendrian submanifolds 137
7.5. The existence theorem for Legendrian embeddings 139
7.6. Legendrian knots in overtwisted contact manifolds 141
7.7. Murphy’s $h$-principle for loose Legendrian embeddings 142
7.8. Directed immersions and embeddings 146
7.9. Discs attached to $J$-convex boundaries 150

Chapter 8. The Existence Theorem 155
8.1. Some notions from Morse theory 155
8.2. Surrounding stable discs 156
8.3. Existence of complex structures 161
8.4. Existence of Stein structures in complex dimension $\neq 2$ 163
8.5. $J$-convex surrounding functions 167
8.6. $J$-convex retracts 171
8.7. Approximating continuous maps by holomorphic ones 174
8.8. Variations on a theme of E. Kallin 181

Part 3. Morse–Smale Theory for $J$-Convex Functions 185

Chapter 9. Recollections from Morse Theory 187
9.1. Critical points of functions 187
9.2. Zeroes of vector fields 189
9.3. Gradient-like vector fields 192
9.4. Smooth surroundings 198
9.5. Changing Lyapunov functions near critical points 200
### CONTENTS

15.1. From Weinstein to Stein: homotopies 295  
15.2. Proof of the first Stein deformation theorem 298  
15.3. Homotopies of flexible Stein structures 302  

**Part 5. Stein Manifolds and Symplectic Topology** 305  

Chapter 16. Stein Manifolds of Complex Dimension Two 307  
16.1. Filling by holomorphic discs 307  
16.2. Stein fillings 310  
16.3. Stein structures on 4-manifolds 320  

Chapter 17. Exotic Stein Structures 323  
17.1. Symplectic homology 323  
17.2. Exotic Stein structures 325  

Appendix A. Some Algebraic Topology 329  
A.1. Serre fibrations 329  
A.2. Some homotopy groups 331  

Appendix B. Obstructions to Formal Legendrian Isotopies 335  

Appendix C. Biographical Notes on the Main Characters 343  
C.1. Complex analysis 343  
C.2. Differential and symplectic topology 348  

Bibliography 353  

Index 361
Preface

In Spring 1996 Yasha Eliashberg gave a Nachdiplomvorlesung (a one semester graduate course) “Symplectic geometry of Stein manifolds” at ETH Zürich. Kai Cieliebak, at the time a graduate student at ETH, was assigned the task to take notes for this course, with the goal of having lecture notes ready for publication by the end of the course. At the end of the semester we had some 70 pages of typed notes, but they were nowhere close to being publishable. So we buried the idea of ever turning these notes into a book.

Seven years later Kai spent his first sabbatical at the Mathematical Sciences Research Institute (MSRI) in Berkeley. By that time, through work of Donaldson and others on approximately holomorphic sections on the one hand, and gluing formulas for holomorphic curves on the other hand, Weinstein manifolds had been recognized as fundamental objects in symplectic topology. Encouraged by the increasing interest in the subject, we dug out the old lecture notes and began turning them into a monograph on Stein and Weinstein manifolds.

Work on the book has continued on and off since then, with most progress happening during Kai’s numerous visits to Stanford University and another sabbatical 2009 that we both spent at MSRI. Over this period of almost 10 years, the content of the book has been repeatedly changed and its scope significantly extended. Some of these changes and extensions were due to our improved understanding of the subject (e.g., a quantitative version of J-convexity which is preserved under approximately holomorphic diffeomorphisms), others due to new developments such as the construction of exotic Stein structures by Seidel and Smith, McLean, and others since 2005, and Murphy’s h-principle for loose Legendrian knots in 2011. In fact, the present formulation of the main theorems in the book only became clear about a year ago. As a result of this process, only a few lines of the original lecture notes have survived in the final text (in Chapters 2–4).

The purpose of the book has also evolved over the past decade. Our original goal was a complete and detailed exposition of the existence theorem for Stein structures in [42]. While this remains an important goal, which we try to achieve in Chapters 2–8, the book has evolved around the following two broader themes: The first one, as indicated by the title, is the correspondence between the complex analytic notion of a Stein manifold and the symplectic notion of a Weinstein manifold. The second one is the extent to which these structures are flexible, i.e., satisfy an h-principle. In fact, until recently we believed the border between flexibility and rigidity to run between subcritical and critical structures, but Murphy’s h-principle extends flexibility well into the critical range.

The book is roughly divided into “complex” and “symplectic” chapters. Thus Chapters 2–5 and 8–10 can be read as an exposition of the theory of J-convex
functions on Stein manifolds, while Chapters 6–7, 9 and 11–14 provide an introduction to Weinstein manifolds and their deformations. However, our selection of material on both the complex and symplectic side is by no means representative for the respective fields. Thus on the complex side we focus only on topological aspects of Stein manifolds, ignoring most of the beautiful subject of several complex variables. On the symplectic side, the most notable omission is the relationship between Weinstein domains and Lefschetz fibrations over the disc.

Over the past 16 years we both gave many lecture courses, seminars, and talks on the subject of this book not only at our home institutions, Ludwig-Maximilians-Universität München and Stanford University, but also at various other places such as the Forschungsinstitut für Mathematik at ETH Zürich, University of Pennsylvania in Philadelphia, Columbia University in New York, the Courant Institute of Mathematical Sciences in New York, University of California in Berkeley, Washington University in St. Louis, the Mathematical Sciences Research Institute in Berkeley, the Institute for Advanced Study in Princeton, and the Alfréd Rényi Institute of Mathematics in Budapest. We thank all these institutions for their support and hospitality.

We thank G. Herold, T. Müller, and S. Prüfer for creating the figures, and J. Wright Sharp for her help with English and LaTeX.

And most of all, we thank our spouses, Suny and Ada, for their continued support.

A beautiful and comprehensive introduction to this important field.

—Dusa McDuff, Barnard College, Columbia University

This excellent book gives a detailed, clear, and wonderfully written treatment of the interplay between the world of Stein manifolds and the more topological and flexible world of Weinstein manifolds. Devoted to this subject with a long history, the book serves as a superb introduction to this area and also contains the authors’ new results.

—Tomasz Mrowka, MIT

This book is devoted to the interplay between complex and symplectic geometry in affine complex manifolds. Affine complex (a.k.a. Stein) manifolds have canonically built into them symplectic geometry which is responsible for many phenomena in complex geometry and analysis. The goal of the book is the exploration of this symplectic geometry (the road from “Stein to Weinstein”) and its applications in the complex geometric world of Stein manifolds (the road “back”). This is the first book which systematically explores this connection, thus providing a new approach to the classical subject of Stein manifolds. It also contains the first detailed investigation of Weinstein manifolds, the symplectic counterparts of Stein manifolds, which play an important role in symplectic and contact topology.

Assuming only a general background from differential topology, the book provides introductions to the various techniques from the theory of functions of several complex variables, symplectic geometry, $h$-principles, and Morse theory that enter the proofs of the main results. The main results of the book are original results of the authors, and several of these results appear here for the first time. The book will be beneficial for all students and mathematicians interested in geometric aspects of complex analysis, symplectic and contact topology, and the interconnections between these subjects.
