## Contents

Preface vii  
List of Participants xi  

**Plenary Talks**  
Integrable lattice models from four-dimensional field theories  
Kevin Costello 3  
Anomalies and invertible field theories  
Daniel S. Freed 25  
Categorical base loci and spectral gaps, via Okounkov bodies and Nevanlinna theory  
Ludmil Katzarkov and Yijia Liu 47  
Rankin-Selberg methods for closed string amplitudes  
Boris Pioline 119  
Singular fibers and Coulomb phases  
Sakura Schäfer-Nameki 145  
The physics and the mixed Hodge structure of Feynman integrals  
Pierre Vanhove 161  

**Contributed Talks**  
Polynomial rings and topological strings  
Murad Alim 197  
Exploring novel geometry in heterotic/F-theory dual pairs  
Lara B. Anderson 209  
Massless spectrum for hybrid CFTs  
Marco Bertolini, Ilarion V. Melnikov, and M. Ronen Plesser 221  
A quick guide to defect orbifolds  
Ilka Brunner, Nils Carqueville, and Daniel Plencner 231  
Geometric T-dualization  
Calder Daenzer 243  
Mirror symmetry in flavored affine $D$-type quivers  
Anindya Dey 269
Duality domain walls in class $S[A_1]$  
Tudor Dimofte  

Calabi-Yau fourfolds in products of projective space  
James Gray, Alexander Haupt, and Andre Lukas  

Poisson AKSZ theories and their quantizations  
Theo Johnson-Freyd  

Modularity, Calabi-Yau geometry and 2d CFTs  
Christoph A. Keller  

Three dimensional mirror symmetry and integrability  
Peter Koroteev  

Strict deformation quantisation of the $G$-connections via Lie groupoid  
Alan Lai  

Supersymmetric boundary conditions in 3D $\mathcal{N} = 2$ theories  
Tadashi Okazaki and Satoshi Yamaguchi  

Instanton-soliton loops in 5D super-Yang-Mills  
Constantinos Papageorgakis and Andrew B. Royston  

2d SCFT from M-branes and its spectral network  
Chan Y. Park
Preface

The conference ‘String-Math 2013’ was held June 17–21, 2013 at the Simons Center for Geometry and Physics. This was the third in a series of large meetings exploring the interface of mathematics and string theory. This volume presents the proceedings of that conference.

The nature of interactions between mathematicians and physicists has been thoroughly transformed in recent years. String theory and quantum field theory have contributed a series of profound ideas which gave rise to entirely new mathematical fields and revitalized older ones. The influence flows in both directions, with mathematical techniques and ideas contributing crucially to major advances in string theory. There is now a large and rapidly growing number of both mathematicians and physicists working at the string-theoretic interface between the two academic fields.

For mathematics, string theory has been a source of many significant inspirations, ranging from Seiberg-Witten theory in four-manifolds, to enumerative geometry and Gromov-Witten theory in algebraic geometry, to work on the Jones polynomial in knot theory, to recent progress in the geometric Langlands program and the development of derived algebraic geometry and n-category theory. In the other direction, mathematics has provided physicists with powerful tools, ranging from powerful differential geometric techniques for solving or analyzing key partial differential equations, to toric geometry, to K-theory and derived categories in D-branes, to the analysis of Calabi-Yau manifolds and string compactifications, to the use of modular forms and other arithmetic techniques. The depth, power and novelty of the results obtained in both fields thanks to their interaction is truly mind-boggling.

In the past few years, the annual String-Math conferences have become the central venue for these profound and wide-ranging interactions. They bring together the leading mathematicians and mathematically-minded physicists working in this interface. These meetings promote and publicize such interactions, giving attendees greater opportunities to cross cultural boundaries, learn aspects of other fields relevant for their research, and advertise important developments to audiences that might not otherwise hear of them or appreciate their importance.

The 2013 conference was organized by Alexander Abanov, Michael Douglas, Ljudmila Kamenova, Claude LeBrun, John Morgan, Nikita Nekrasov, Leonardo Rastelli, and Martin Roček. The Steering Committee consisted of Ron Donagi, Dan Freed, Nigel Hitchin, Sheldon Katz, Maxim Kontsevich, David Morrison, Edward Witten, and Shing-Tung Yau. The meeting covered a wide array of topics at the interface of mathematics and high energy physics, including:
• New and exotic supersymmetric field theories
• Localization and gauge theory
• Gauge theory and Khovanov homology
• Perturbative amplitudes
• Topological phases of matter
• Gauge theory angle at integrability
• Homological mirror symmetry
• Categorical constructions of topological field theories
• Mathematical string phenomenology
• Non-perturbative dualities, F-theory
• Wall-crossing formulas
• Hitchin systems
• Geometric Langlands
• Arithmetic of strings
• Gromov-Witten theory and enumerative geometry
• A-twisted Landau-Ginzburg models
• String topology
• Elliptic cohomology
• Heterotic mirror symmetry
• Topological T duality
• Superstring scattering amplitudes
• Chiral de Rham complexes
• Noncommutative geometry

Altogether, this conference brought together approximately 130 mathematicians and physicists. There were 24 invited plenary talks given by leaders in both fields. Additionally, there were 32 contributed talks given in parallel sessions on the Tuesday and Wednesday of the meeting. All the talks are available at the conference web site: http://scgp.stonybrook.edu/events/event-pages/string-math-2013.

The math/strings collaboration is clearly here to stay, and we expect this conference series to continue as long the subject remains active and exciting. The venues and years of the first seven conferences of the String-Math series are:

• String-Math 2011, Philadelphia (Penn), June 6–11, 2011
• String-Math 2012, Bonn (Hausdorff center for Mathematics), July 16–21, 2012
• String-Math 2013, Stony Brook (Simons Center for Geometry and Physics), June 17–21, 2013
• String-Math 2015, China (Tsinghua Sanya International Mathematics Forum, Sanya, Hainan, China), Dec 31, 2015–Jan 5, 2016
• String-Math 2017, Hamburg

The conference benefitted from support obtained from the NSF (grant number: NSF DMS 1305697 String-Math 2013) and from SCGP. We are also very grateful to Sergei Gelfand and Chris Thivierge of AMS for their help in various stages of preparing this volume.
The editors of String-Math 2013:

Ron Donagi

Michael Douglas

Ljudmila Kamenova
