

CONTENTS

1. Introduction	1
1.1. Motivations	1
1.2. General assumptions and notations	4
1.3. Simple results	8
1.4. Strategy and outline of the book	10
2. Boundary Witten Laplacians	13
2.1. Tangential and normal traces	13
2.2. Witten's deformation	17
2.3. Agmon's type estimates	21
3. Local problems	35
3.1. Useful quantities and notations	35
3.2. Exponentially small eigenvalues are zero	37
3.3. Consequences	43
4. Rough estimates for several "critical values"	51
4.1. Bar code associated with f	51
4.2. Counting exponentially small eigenvalues	52
4.3. Rough exponential estimates	55
5. Singular values	59
6. Accurate analysis with N "critical values"	71
6.1. Assumptions, notations and main result	71
6.2. Initialisation and outline of the recurrence	75
6.3. Consequences of Theorem 6.3 at step N	77
6.4. $N \rightarrow N + 1$: Collecting the information from step N	83
6.5. $N \rightarrow N + 1$: Handling the bars containing $[\tilde{c}_1, \tilde{c}_{N+1}]$	89
6.6. Lower bound for non zero singular values at step $N + 1$	92
6.7. Construction of the family $(\varphi_j^h)_{j \in \mathcal{J}^*(a,b)}$ at step $N + 1$	99
7. Corollaries of Theorem 6.3	103
7.1. Spectral results	103
7.2. Quasi-isomorphisms	109
7.3. Stability theorem	112
8. Generalizations	115
8.1. More general domains	115

8.2. More general manifolds	116
8.3. More general Lipschitz functions	119
9. Applications	139
9.1. The generic Morse case	139
9.2. Simple critical values for non Morse functions	146
9.3. More general Morse functions	158
10. Broadening the scope	169
A. Abstract Hodge theory	175
B. Persistent cohomology and bar codes	179
B.1. A sheaf theoretic presentation	179
B.2. Trivialized complex	183
B.3. Stability theorem	185
Bibliography	187
