

TABLE OF CONTENTS

CHAPTER	PAGE
I. THE NATURE OF THE PROBLEMS AND UNDERLYING CONCEPTS OF MATHEMATICAL STATISTICS	1
1. The scope of mathematical statistics	
2. Historical remarks	
3. Two general types of problems	
4. Relative frequency and probability	
5. Observed and theoretical frequency distributions	
6. The arithmetic mean and mathematical expecta- tion	
7. The mode and the most probable value	
8. Moments and the mathematical expectations of powers of a variable	
II. RELATIVE FREQUENCIES IN SIMPLE SAMPLING	22
9. The binomial description of frequency	
10. Mathematical expectation and standard deviation of the number of successes	
11. Theorem of Bernoulli	
12. The De Moivre-Laplace theorem	
13. The quartile deviation	
14. The law of small probabilities. The Poisson expo- nential function	
III. FREQUENCY FUNCTIONS OF ONE VARIABLE	46
15. Introduction	
16. The Pearson system of generalized frequency curves	
17. Generalized normal curves—Gram-Charlier series	
18. Remarks on the genesis of Type A and Type B forms	
19. The coefficients of the Type A series expressed in moments of the observed distribution	
20. Remarks on two methods of determining the co- efficients of the Type A series	

CHAPTER	PAGE
21. The coefficients of the Type B series	
22. Remarks	
23. Skewness	
24. Excess	
25. Remarks on the distribution of certain transformed variates	
26. Remarks on the use of various frequency functions as generating functions in a series representation	
IV. CORRELATION	77
27. Meaning of simple correlation	
28. The regressive method and the correlation surface method of describing correlation	
29. The correlation coefficient	
THE REGRESSION METHOD OF DESCRIPTION	
30. Linear regression	
31. The standard deviation of arrays—mean square error of estimate	
32. Non-linear regression—the correlation ratio	
33. Multiple correlation	
34. Partial correlation	
35. Non-linear regression in n variables—multiple correlation ratio	
36. Remarks on the place of probability in the regression method	
THE CORRELATION SURFACE METHOD OF DESCRIPTION	
37. Normal correlation surfaces	
38. Certain properties of normally correlated distributions	
39. Remarks on further methods of characterizing correlation	
V. ON RANDOM SAMPLING FLUCTUATIONS	114
40. Introduction	
41. Standard error and correlation of errors in class frequencies	

TABLE OF CONTENTS

xi

CHAPTER	PAGE
42. Remarks on the assumptions involved in the derivation of standard errors	
43. Standard error in the arithmetic mean and in a q th moment coefficient about a fixed point	
44. Standard error of the q th moment μ_q about a mean	
45. Remarks on the standard errors of various statistical constants	
46. Standard error of the median	
47. Standard deviation of the sum of independent variables	
48. Remarks on recent progress with sampling errors of certain averages obtained from small samples	
49. The recent generalizations of the Bienaymé-Tchebycheff criterion	
50. Remarks on the sampling fluctuations of an observed frequency distribution from the underlying theoretical distribution	
VI. THE LEXIS THEORY	146
51. Introduction	
52. Poisson series	
53. Lexis series	
54. The Lexis ratio	
VII. A DEVELOPMENT OF THE GRAM-CHARLIER SERIES . .	156
55. Introduction	
56. On a development of Type A and Type B from the law of repeated trials	
57. The values of the coefficients of the Type A series obtained from the biorthogonal property	
58. The values of the coefficients of type A series obtained from a least-squares criterion	
59. The coefficients of a Type B series
