Preface	xi
1 Introduction and Overview	1
1.1 Towards a mathematical description	5
1.1.1 Theoretical assumptions	7
1.1.2 Discrete versus continuous atmosphere, conservation laws	9
1.2 Overview of the contents	11
1.2.1 On Part I: Geometry of light rays in the atmosphere	11
1.2.2 On Part II: Light rays as geodesics	13
1.3 Scholium	14
I Geometry of light rays in the atmosphere	
2 Geometric optics	19
2.1 More precise setting of the problem	20
2.2 Derivation of the reflection and refraction laws	21
2.2.1 A straight boundary	22
2.2.2 A curved boundary	24
2.2.3 The limit angle	25
2.3 Conservation laws	27
2.3.1 Atmosphere of the flat earth	28
2.3.2 Atmosphere of the round earth	32
2.4 Scholium	36

3	Atmospheric optics	41
3.1	Fundamental concepts and terminology	42
3.2	Discrete description of the atmosphere	45
3.2.1	The Wegener sector	46
3.2.2	Optical scenarios near the horizon	48
3.2.2.1	The setting sun	48
3.2.2.2	Including lower reflection	52
3.2.2.3	Fata morganas	53
3.2.3	Variations	57
3.2.3.1	Takens–profiles	57
3.2.3.2	The green flash	60
3.3	Continuous description of the atmosphere	61
3.3.1	The conservation law revisited	61
3.3.2	Wegener sight ray	62
3.4	Scholium	65
3.4.1	Deepening	66
3.4.2	Nova Zembla phenomenon	67
4	Light and the cycloid	69
4.1	The cycloid	69
4.2	The cycloid as isochrone and tautochrone curve	71
4.2.1	The harmonic oscillator	72
4.2.2	Intermezzo: the arclength of a cycloid	77
4.2.3	Dynamics along the cycloid	78
4.2.4	A historical digression	80
4.2.5	Two cycloids	83
4.2.6	Scholium	88
4.3	The flat earth atmosphere revisited	89
4.3.1	Two conservation laws	89
4.3.2	The cycloid as the brachistochrone curve	90
4.4	Scholium	93

II Light rays as geodesics

5	The principles of Fermat and Hamilton	99
5.1	From Fermat via Euler-Lagrange to Hamilton	100
5.1.1	Light rays as geodesics	102
5.1.2	Euler and Lagrange	103
5.1.3	Via Legendre to Hamilton	105
5.1.4	General remarks	106
5.2	The Noether Principle: Conservation laws by symmetry	108
5.2.1	The flat earth atmosphere	109
5.2.2	The round earth atmosphere	111
5.3	Reduction of the symmetry	112
5.4	Scholium	116
6	The brachistochrone revisited	119
6.1	Reduction of the translation symmetry	119
6.2	The cycloid recovered	121
6.3	Scholium	124
7	Light rays as geodesics on a surface of revolution	127
7.1	Summary of the chapter	127
7.2	Geodesics on a surface of revolution	128
7.3	Dynamics of the geodesics	130
7.3.1	According to Euler–Lagrange	130
7.3.2	According to Hamilton	131
7.4	Conservation laws	131
7.4.1	Reducing the symmetry	132
7.4.2	Description of the geodesics	133
7.4.2.1	Near a geodesic parallel	134
7.4.2.2	Reconstruction to four dimensions	137
7.4.3	More global behavior of geodesics	137
7.5	Geodesics and light rays	139
7.6	Isometric embeddability	142

7.7	Scholium	144
7.7.1	Rotation symmetry with or without surface of revolution	144
7.7.2	Free particle on a surface of revolution	144
8	Scholium generale	149
8.1	Approximate rotational symmetry	149
8.2	A connection with wave optics	152
8.3	Caustics	152
	Bibliography	155
	Index	161
