<b>Preface</b>	<b>v</b>
<b>1 Introduction</b>	<b>1</b>
1.1 Mars . . . . .	1
1.1.1 Motion of Mars . . . . .	2
1.1.2 The “far out” planets . . . . .	4
1.2 Mercury . . . . .	6
1.3 Epicycles . . . . .	11
1.4 Chaotic behavior . . . . .	13
1.4.1 Newton’s method . . . . .	14
1.4.2 Period three and circle maps . . . . .	19
1.4.3 The forced Van der Pol equations . . . . .	23
1.5 The rings of Saturn . . . . .	26
1.5.1 Kinky behavior . . . . .	26
1.5.2 A model . . . . .	27
<b>2 Central configurations</b>	<b>31</b>
2.1 Equations of motion and integrals . . . . .	32
2.2 Central Configurations . . . . .	34
2.2.1 Why central configurations are important . . . . .	36
2.2.2 Value of $\lambda$ . . . . .	40
2.2.3 Equivalence classes of configurations . . . . .	42
2.3 A conjecture and a velocity decomposition . . . . .	47
2.3.1 Virial Theorem and the conjecture . . . . .	47
2.3.2 The system velocity decomposition . . . . .	51
2.3.3 Central configurations and the velocity decomposition . . . . .	54
2.3.4 Motion preserving an Euler similarity class . . . . .	56

2.3.5	Sundman inequality . . . . .	61
2.4	More conjectures . . . . .	65
2.4.1	Another conjecture . . . . .	65
2.4.2	Special cases . . . . .	67
2.5	Jacobi coordinates help “see” the dynamics . . . . .	69
2.5.1	Velocity decomposition and a basis . . . . .	71
2.5.2	Describing $\rho''$ with the basis . . . . .	74
2.5.3	“Seeing” the gradient of $U$ . . . . .	76
2.5.4	An illustrating example . . . . .	77
2.5.5	Finding central and other configurations . . . . .	79
2.5.6	Equations of motion for constant $I$ . . . . .	80
2.5.7	Basis for the coplanar $N$ -body problem . . . . .	81
<b>3</b>	<b>Finding Central Configurations</b>	<b>83</b>
3.1	From the ancient Greeks to . . . . .	84
3.1.1	Arithmetic and geometric means . . . . .	84
3.1.2	Connection with central configurations . . . . .	88
3.2	Constraints . . . . .	92
3.2.1	Singularity structure of $F$ . . . . .	94
3.2.2	Some dynamics . . . . .	97
3.2.3	Stratified structure of the image of $F$ . . . . .	99
3.3	Geometric approach—the rule of signs . . . . .	102
3.3.1	The “configurational averaged length” $\xi_{CAL}$ . . . . .	103
3.3.2	Signs of gradients—coplanar configurations . . . . .	105
3.3.3	Signs of gradients—three-dimensional configurations . . . . .	106
3.3.4	Degenerate configurations . . . . .	107
3.4	Consequences for central configurations . . . . .	109
3.4.1	Surprising regularity . . . . .	109
3.4.2	Estimates on $\xi_{CAL}$ . . . . .	112
3.4.3	Are there central configurations of these types? . . . . .	114
3.5	What can, and cannot, be . . . . .	115
3.5.1	More central configurations . . . . .	115
3.5.2	Masses and collinear central configurations . . . . .	119
3.5.3	Masses and coplanar configurations . . . . .	124
3.6	New kinds of constraints . . . . .	126
3.7	Rings of Saturn . . . . .	130
3.7.1	Stability . . . . .	131
3.7.2	More rings . . . . .	133
3.7.3	Saturn, and some problems . . . . .	136

<b>4</b>	<b>Collisions – both real and imaginary</b>	<b>137</b>
4.1	One body problem . . . . .	138
4.1.1	Levi-Civita’s approach . . . . .	140
4.1.2	Kustaanheimo and Stiefel’s approach . . . . .	141
4.1.3	Topological obstructions and hairy balls . . . . .	143
4.1.4	Sundman’s solution of the three-body problem . . . . .	144
4.2	Sundman and the three-body problem . . . . .	147
4.2.1	Complex singularities? . . . . .	147
4.2.2	Avoiding complex singularities . . . . .	148
4.2.3	Singularities retaliate . . . . .	149
4.3	Generalized Weierstrass-Sundman theorem . . . . .	150
4.3.1	A simple case—the central force problem . . . . .	151
4.3.2	Larger $p$ -values and “Black Holes” . . . . .	151
4.3.3	Lagrange-Jacobi equation . . . . .	153
4.3.4	Proof of the Weierstrass-Sundman Theorem . . . . .	154
4.3.5	Bounded above means bounded below . . . . .	159
4.3.6	Problems . . . . .	161
4.3.7	An interesting historical footnote . . . . .	161
4.4	Singularities – an overview . . . . .	162
4.4.1	Behavior of a singularity . . . . .	163
4.4.2	Non-collision singularities . . . . .	165
4.4.3	Off to infinity . . . . .	166
4.4.4	Problems . . . . .	170
4.5	Rate of approach of collisions . . . . .	172
4.5.1	General collisions . . . . .	172
4.5.2	Tauberian Theorems . . . . .	173
4.5.3	Proof of the theorem . . . . .	179
4.6	Sharper asymptotic results . . . . .	184
4.7	Spin, or no spin? . . . . .	185
4.7.1	Using the angular momentum . . . . .	187
4.7.2	The collinear case . . . . .	189
4.8	Manifolds defined by collisions . . . . .	191
4.8.1	Structure of collision sets . . . . .	192
4.8.2	Proof of Theorem 4.18 . . . . .	193
4.9	Proof of the slowly varying assertion . . . . .	195
4.9.1	Centers of mass . . . . .	198
4.9.2	Back to the proof . . . . .	201
4.9.3	The last steps . . . . .	203

<b>5</b>	<b>How likely is it?</b>	<b>207</b>
5.1	Motivation . . . . .	208
5.1.1	Idea of proof . . . . .	209
5.1.2	Why do we need the Baire category statement? . . . .	210
5.2	Proof: $\mathcal{C}$ is of first Baire category . . . . .	210
5.2.1	Finding an appropriate $\mathcal{C}$ subset . . . . .	211
5.2.2	A comment about the set of singularities . . . . .	213
5.3	Proof: $\mathcal{C}$ is of Lebesgue measure zero . . . . .	214
5.3.1	A common collision for $k \geq 3$ particles . . . . .	214
5.3.2	Lower dimensions, binary collisions, and other force laws . . . . .	217
5.4	Likelihood of non-collision singularities . . . . .	220
	<b>Bibliography</b>	<b>223</b>
	<b>Index</b>	<b>232</b>
