

Contents

Preface	vii
Chapter 1. The derivative operator	1
1.1. Hermite polynomials and chaos expansions	1
1.2. Derivative operator: Definition and properties	3
1.3. Derivative in the white noise case	9
Chapter 2. The divergence operator	13
2.1. Properties of the divergence	13
2.2. The divergence in the white noise case	15
2.3. Clark-Ocone formula	17
Chapter 3. The Ornstein-Uhlenbeck semigroup	19
3.1. Mehler's formula	19
3.2. Hypercontractivity	20
3.3. The generator of the Ornstein-Uhlenbeck semigroup	23
Chapter 4. Sobolev spaces and equivalence of norms	27
4.1. Meyer inequalities	27
4.2. A continuous family of seminorms and Sobolev spaces	29
4.3. Continuity of the divergence	30
Chapter 5. Regularity of probability laws	33
5.1. Existence and formulas for probability densities	33
5.2. Regularity of the density	35
Chapter 6. Support properties. Density of the maximum	39
6.1. Properties of the support of the law	39
6.2. Regularity of the law of the maximum of continuous processes	40
Chapter 7. Application of Malliavin calculus to diffusion processes	45
7.1. Differentiability of the solution	46
7.2. Existence of densities under ellipticity conditions	48
7.3. Regularity of the density under Hörmander's conditions	49
Chapter 8. The divergence operator as a stochastic integral	55
8.1. Skorohod integral	55
8.2. Stochastic calculus for fractional Brownian motion	59
Chapter 9. Central limit theorems and Malliavin calculus	67
9.1. Central limit theorems via chaos expansions	67
9.2. Stein's method and Malliavin calculus	72

Chapter 10. Applications of Malliavin calculus in finance	75
10.1. Black-Scholes model	75
10.2. Computation of Greeks	76
10.3. Application of the Clark-Ocone formula in hedging	80
Bibliography	81
Index	85
