

Contents

Preface	vii
Chapter 1. Introduction	1
Chapter 2. The example of the GUE	9
Chapter 3. Wigner random matrices	19
3.1. Law of large numbers: Light tails	19
3.2. Law of large numbers: Heavy tails	26
3.3. CLT	30
Chapter 4. Beta-ensembles	35
4.1. Law of large numbers and large deviation principles	35
4.2. Concentration of measure	42
4.3. The Dyson-Schwinger equations	46
4.4. Expansion of the partition function	54
4.5. The Stieltjes transforms approach	57
Chapter 5. Discrete beta-ensembles	63
5.1. Large deviations, law of large numbers	64
5.2. Concentration of measure	66
5.3. Nekrasov's equations	68
5.4. Second order expansion of linear statistics	75
5.5. Expansion of the partition function	76
Chapter 6. Continuous beta-models: The several cut case	79
6.1. The fixed filling fractions model	80
6.2. Central limit theorem for the full model	88
Chapter 7. Several matrix-ensembles	91
7.1. Non-commutative derivatives	92
7.2. Non-commutative Dyson-Schwinger equations	93
7.3. Independent GUE matrices	93
7.4. Several interacting matrices models	95
7.5. Second order expansion for the free energy	106
Chapter 8. Universality for beta-models	117
Bibliography	137
Index	143
