Preface	xi
Introduction	1
Moduli spaces and deformation classes	2
Axiom System for field theory	3
Symmetries	5
Extended Locality	6
Invertibility and homotopy theory	7
Extended unitarity	8
Non-topological invertible theories	9
Theorems	9
Free spinor fields	10
Anomalies	11
Final remarks	11
Lecture 1. Bordism and Topological Field Theories	13
1.1. Classical bordism	14
1.2. Topological field theories	16
1.3. Structures on manifolds; further examples	20
1.4. Varying the codomain: super vector spaces	23
1.5. Bordism and homotopy theory	24
Lecture 2. Quantum Mechanics	29
2.1. An axiomatic view of Hamiltonian mechanics	29
2.2. Example: particle on a manifold	33
2.3. Example: a lattice system (toric code)	34
2.4. Families of quantum systems	36
2.5. Wick rotation in quantum mechanics	39
2.6. The Axiom System in quantum mechanics	39
Lecture 3. Wick-Rotated Quantum Field Theory and Symmetry	43
3.1. Axiom System for quantum field theory	44
3.2. Relativistic quantum field theory	46
3.3. Wick rotation of relativistic quantum field theory	47
3.4. Symmetry groups in quantum field theory	48
3.5. Interlude on differential geometry	52
3.6. Wick-rotated field theory on compact manifolds	53
Lecture 4. Classification Theorems	55
4.1. Review of Morse and Cerf theory	55
4.2. Classification of 2-dimensional topological field theories	58

4.3.	2-dimensional area-dependent theories	64
4.4.	Classification of 1-dimensional field theories	66
Lecture 5.	Extended Locality	71
5.1.	Higher categories	71
5.2.	Examples of higher categories	73
5.3.	Extended field theories	76
5.4.	Extended operators	78
5.5.	Algebra structures on spheres	80
5.6.	Cobordism hypothesis	81
5.7.	Extended example	82
Lecture 6.	Invertibility and Stable Homotopy Theory	85
6.1.	Categorical preliminaries	86
6.2.	Invertible field theories	86
6.3.	Geometric realization of 1-dimensional bordism	88
6.4.	Non-extended invertible field theories and Reinhart bordism	90
6.5.	Picard groupoids and spectra	92
6.6.	Madsen-Tillmann and Thom spectra	93
6.7.	Duals to the sphere spectrum	98
6.8.	Invertible field theories as maps of spectra	100
6.9.	Deformation classes of invertible field theories	101
6.10.	Continuous invertible topological field theories	102
Lecture 7.	Wick-Rotated Unitarity	105
7.1.	Positive definite Hermitian vector spaces	105
7.2.	Wick-rotated unitarity in quantum mechanics	106
7.3.	Wick-rotated unitarity in Euclidean quantum field theory	107
7.4.	Reflection structures and naive positivity	110
7.5.	Positivity and doubles	113
7.6.	Introduction to extended reflection structures and positivity	116
Lecture 8.	Extended Positivity and Stable Homotopy Theory	119
8.1.	Naive positivity and stability	120
8.2.	Equivariant spectra	121
8.3.	Complex conjugation	123
8.4.	Higher super lines	124
8.5.	Spaces of invertible field theories; extended positivity	126
8.6.	Main theorems	129
Lecture 9.	Non-Topological Invertible Field Theories	131
9.1.	Short-range entangled lattice systems; topological* field theories	131
9.2.	The long range limit of 3-dimensional Yang-Mills + Chern-Simons	135
9.3.	Examples of non-topological invertible theories	136
9.4.	Differential cohomology and a conjecture	139
Lecture 10.	Computations for Electron Systems	143
10.1.	The 10-fold way for free electron systems	144
10.2.	The long range effective theory of free fermions	146

10.3. Computations	149
10.4. Conclusions	151
Lecture 11. Anomalies in Field Theory	153
11.1. Pfaffians of Dirac operators	154
11.2. Anomalies as invertible field theories	156
11.3. The anomaly theory of a free spinor field	158
11.4. Anomalies everywhere	160
Appendix A. Review of Categories	165
A.1. Categories and groupoids	165
A.2. Symmetric monoidal categories and duality	167
A.3. Symmetric monoidal functors	169
A.4. Picard groupoids	171
A.5. Involutions	172
Bibliography	175
Index	185
