|---|-----------|
| Preface   | xi        |
| Chapter 1. Matrix and operator conventions          | 1         |
| 1.1. Matrices and matrix coefficients               | 1         |
| 1.2. Schatten matrix norms                          | 7         |
| 1.3. Matrices of operators                          | 10        |
| <b>Part 1. Examples and Three Basic Theorems</b>    | <b>15</b> |
| Chapter 2. The representation theorem               | 17        |
| 2.1. Concrete and abstract operator spaces          | 17        |
| 2.2. Completely bounded linear mappings             | 21        |
| 2.3. The representation theorem                     | 27        |
| 2.4. Notes and references                           | 33        |
| Chapter 3. Constructions and examples               | 35        |
| 3.1. Subspaces, quotients, products, and conjugates | 35        |
| 3.2. Dual spaces and mapping spaces                 | 38        |
| 3.3. The min and max quantizations                  | 45        |
| 3.4. Column and row Hilbert operator spaces         | 51        |
| 3.5. Pisier's self-dual Hilbert operator spaces     | 57        |
| 3.6. Notes and references                           | 61        |
| Chapter 4. The extension theorem                    | 63        |
| 4.1. The Arveson–Wittstock theorem and injectivity  | 63        |
| 4.2. Duality for subspaces and quotients            | 72        |
| 4.3. Notes and references                           | 74        |
| Chapter 5. Operator systems and decompositions      | 75        |
| 5.1. Operator systems and complete positivity       | 75        |
| 5.2. The Stinespring theorem and its consequences   | 81        |
| 5.3. Decompositions of complete contractions        | 84        |
| 5.4. Decomposability                                | 91        |
| 5.5. Matrix convexity and the trace class operators | 99        |
| 5.6. Notes and references                           | 101       |

|  |            |
|--|------------|
| Chapter 6. Injectivity                                       | 103        |
| 6.1. The injective operator spaces                           | 103        |
| 6.2. Injective envelopes                                     | 111        |
| 6.3. Notes and references                                    | 114        |
| <b>Part 2. Tensor Products</b>                               | <b>115</b> |
| Chapter 7. The projective tensor product                     | 119        |
| 7.1. Definition and elementary properties                    | 119        |
| 7.2. Trace class operators and a Fubini theorem              | 128        |
| 7.3. Notes and references                                    | 132        |
| Chapter 8. The injective tensor product                      | 133        |
| 8.1. Definition and elementary properties                    | 133        |
| 8.2. Relating Banach and operator space tensor products      | 141        |
| 8.3. Notes and references                                    | 143        |
| Chapter 9. The Haagerup tensor product                       | 145        |
| 9.1. Multiplicatively bounded mappings                       | 146        |
| 9.2. The tensor product and its elementary properties        | 149        |
| 9.3. Some tensor product computations                        | 157        |
| 9.4. Multilinear decompositions                              | 160        |
| 9.5. Notes and references                                    | 170        |
| Chapter 10. Infinite matrices and asymptotic constructions   | 173        |
| 10.1. Infinite matrices over an operator space               | 173        |
| 10.2. Representing elements of the projective tensor product | 181        |
| 10.3. Ultraproducts  | 182        |
| 10.4. Notes and references                                   | 189        |
| <b>Part 3. The Grothendieck Programme</b>                    | <b>191</b> |
| Chapter 11. The approximation property                       | 193        |
| 11.1. The Grothendieck approximation property                | 193        |
| 11.2. The operator space approximation property              | 195        |
| 11.3. Tomiyama's slice mapping property                      | 201        |
| 11.4. Notes and references                                   | 204        |
| Chapter 12. Mapping spaces                                   | 207        |
| 12.1. Nuclear and integral mappings of Banach spaces         | 207        |
| 12.2. Completely nuclear mappings                            | 210        |
| 12.3. Completely integral mappings                           | 216        |
| 12.4. Notes and references                                   | 223        |
| Chapter 13. Absolutely summing mappings                      | 225        |
| 13.1. 1-summing mappings of Banach spaces                    | 225        |
| 13.2. Completely 1-summing mappings                          | 230        |

|   |            |
|---|------------|
| 13.3. Hilbert space factorable mappings   | 235        |
| 13.4. The Dvoretzky–Rogers theorem for operator spaces                          | 239        |
| 13.5. Notes and references  | 240        |
| <b>Part 4. Local Theory and Integrality</b>                                     | <b>241</b> |
| Chapter 14. Local reflexivity, exactness, and nuclearity                        | 243        |
| 14.1. The local structure of Banach spaces                                      | 243        |
| 14.2. The Archbold–Batty conditions   | 247        |
| 14.3. Local reflexivity and condition $C''$                                     | 252        |
| 14.4. Exactness and condition $C'$  | 260        |
| 14.5. Examples of non-exact operator spaces                                     | 269        |
| 14.6. Nuclear operator spaces   | 275        |
| 14.7. Notes and references  | 281        |
| Chapter 15. Local reflexivity and exact integrality                             | 283        |
| 15.1. The Junge approximation theorem   | 283        |
| 15.2. Exactly integral mappings I   | 284        |
| 15.3. Strong local reflexivity for von Neumann algebra preduals                 | 286        |
| 15.4. Exactly integral mappings II  | 290        |
| 15.5. Relating the mapping spaces   | 297        |
| 15.6. Notes and references  | 302        |
| <b>Part 5. Some Algebraic Applications</b>                                      | <b>303</b> |
| Chapter 16. Non-commutative harmonic analysis                                   | 305        |
| 16.1. Quantized Banach algebras   | 305        |
| 16.2. Operator amenability for Fourier algebras                                 | 314        |
| 16.3. Notes and references  | 318        |
| Chapter 17. An abstract characterization for non-self-adjoint operator algebras | 319        |
| 17.1. Quantized function algebras   | 319        |
| 17.2. Notes and references  | 324        |
| Appendix. Preliminaries   | 327        |
| A.1. Linear spaces  | 327        |
| A.2. Banach spaces  | 328        |
| A.3. Hilbert spaces   | 333        |
| A.4. $C^*$ -algebras and von Neumann algebras                                   | 334        |
| A.5. A brief list of operator algebras  | 338        |
| A.6. Asymptotic products and ultraproducts of Banach spaces                     | 339        |
| Bibliography  | 345        |
| Index of Notation   | 351        |
| Index   | 355        |
