Preface	vii
Chapter 1. Classical Mechanics of Discrete Systems	1
1.1. Elements of Newtonian Mechanics	1
1.2. Calculus of Variations	7
1.3. Action Principle	12
1.4. Legendre Transformation	18
1.5. Canonical Equations	22
1.6. Rotating Frames of Reference	26
1.7. Remarks on Integrable Systems and Symmetries	27
1.8. Phase Space Geometry	28
1.9. Method of Characteristics	31
1.10. Hamilton–Jacobi Theory	34
1.11. Parametrized Curves	40
1.12. Fermat’s Principle	42
Chapter 2. Wave Mechanics	47
2.1. From Discrete Particles to Continuous Fields	47
2.2. The Stretched String	49
2.3. Canonical Equations	54
2.4. The Two-Dimensional Wave Equation	55
2.5. Geometric Wave Theory	58
2.6. Dispersive Wavetrains	62
2.7. Wavetrain Examples	67
2.8. Fermat’s Principle for Dispersive Waves	69
Chapter 3. Statistical Mechanics	73
3.1. Time and Phase Averaging	74
3.2. Microcanonical Statistical Mechanics	76
3.3. Canonical Statistical Mechanics	82
3.4. Examples of Canonical Mechanics	88
3.5. Free Energy of Macrostates	91
3.6. Maximum Entropy Principle	93
3.7. Variational Approximation Method	96
3.8. Mean Field Theory	99
3.9. Phase Transitions	102
3.10. Numerical Methods	104

Chapter 4. Quantum Mechanics	109
4.1. Specific Heat of Gases	109
4.2. Fundamentals of Quantum States	111
4.3. Operators and Observables	115
4.4. Amplitude Evolution	117
4.5. Particle on a Lattice	125
4.6. Continuous State Space	129
4.7. Evolution of Expectations and Conservation Laws	134
4.8. Path Integral Approach to Quantum Mechanics	136
4.9. Quantum Statistical Mechanics	140
4.10. A Differential Equation for the Canonical Density Matrix	145
Bibliography	149
Index	151
