
Contents

Part I	The symbolism of conditions	1
§1	The number of constants of a structure	1
§2	The description of the conditions	3
§3	The dimension of a condition and the level of a system	5
§4	The principle of conservation of numbers	8
§5	The representation of the numbers of conditions by the symbols of conditions, and computations with these symbols	13
§6	The equations between the elementary conditions of each of the three principal elements	15
Part II	The incidence formulae	19
§7	The incidence formulae for points and lines	19
§8	Applications of incidence formulae (I), (II) and (III) to the incidence of a tangent with its point of contact	20
§9	Further examples for the incidence formulae (I), (II), (III)	21
§10	The remaining incidence formulae	24
§11	Examples for the incidence formulae (IV) to (XIV)	26
§12	Application of the incidence formulae to systems of principal elements incident with principal elements	30
Part III	The coincidence formulae	33
§13	The coincidence formulae of a pair of points and Bezout's theorems ...	33
§14	Application of the coincidence formulae of §13 to determine the numbers concerning contacts of planar curves and surfaces	39
§15	The pair of lines and its coincidence conditions	44
§16	Application of the coincidence formulae for pairs of lines to the two ruled families lying on a surface of degree two [23]	51
§17	The pairs of distinct principal elements and the coincidence conditions	63
§18	Derivation of the Cayley-Brill correspondence formula from the general coincidence formulae for pairs of points	68

Part IV The computations of numbers via degeneracies	71
§19 Numbers for structures consisting of finitely many principal elements	71
§20 Numbers for conic sections [30]	72
§21 The reduction of Chasles and Zeuthen [32]	77
§22 Numbers for surfaces of degree two [33]	81
§23 Numbers for cubic planar curves with cusp [34]	84
§24 Numbers for cubic planar curves with double point [34]	120
§25 Numbers for cubic space curves [35]	136
§26 Numbers for planar curves of order four in a fixed plane	156
§27 Numbers for the linear congruence [40]	159
§28 Numbers for structures consisting of two lines whose points and planes are projective [41]	165
§29 Numbers for structures consisting of a pencil of planes and a pencil of lines projective to it [41]	171
§30 Numbers for the structure consisting of two projective pencils of lines [41]	174
§31 Numbers for structure consisting of two collinear bundles [42]	176
§32 Numbers for structures consisting of two correlative bundles [42]	182
Part V The multiple coincidences	193
§33 Coincidence of intersection points of a line and a surface [43]	193
§34 The coincidence of multiple points on a line [48]	209
§35 The coincidence of multiple lines of a pencil of lines [48]	216
§36 Singularities of the generic line complex [49]	224
Part VI The theory of characteristics	235
§37 The problem of characteristics for an arbitrary structure Γ	235
§38 The problem of characteristics for the conic section [51]	243
§39 Derivation and application of the characteristic formulae for the structure consisting of a line and a point on it [52]	246
§40 Derivation and application of the characteristic formula for the pencil of lines [52]	254
§41 Derivation and application of the characteristic formula for the structure consisting of a line, a point on that line, and a plane through that line [52]	258
§42 The theory of characteristics of the structure consisting of a line and n points on it [53]	261
§43 Computation of the numbers for multiple secants of the intersection curve of two surfaces	271
§44 Theory of characteristics of the structure consisting of a pencil of lines and n lines in it. Application to congruences common to two complexes	275
