Preface	XXV
0 Introduction. Developments concerning projective determinations of measure	3
0.1 The projective determinations of measure in the plane and their division into kinds	3
0.2 The motions belonging to a determination of measure and symmetric transformations of the plane into itself. The variable ζ in the parabolic case	6
0.3 Setting up all collineations of the conic section $z_1 z_3 - z_2^2 = 0$ into itself. Behavior of the associated ζ	10
0.4 The group of the “motion and symmetric transformations” for the hyperbolic and elliptic planes	13
0.5 General definition of the ζ -values for the points of the projective plane.	16
0.6 The ζ -values in the hyperbolic plane. The ζ -halfplane and the ζ -halfplane	18
0.7 The hyperbolic determination of measure in the ζ -halfplane and on the ζ -halfsphere	21
0.8 Remarks on surfaces of constant negative curvature	25
0.9 Illustrations of the motions of the projective plane into itself by figures.	26
0.10 The elliptic plane and the ζ -plane resp. ζ -sphere	30
0.11 Transferring the elliptic determination onto the ζ -plane and ζ -sphere ..	33
0.12 The hyperbolic determination of measure in space and the associated “motions”	36
0.13 Connection of the circle-relations with hyperbolic geometry. The rotation subgroups in hyperbolic space	40
0.14 Mapping of the hyperbolic space onto the ζ -halfplane	43
0.15 Concluding remarks to the introduction	46

1	The discontinuity of groups with illustrations by simple examples	51
1.1	Distinction between continuous and discontinuous substitution groups	51
1.2	Distinction of properly and improperly discontinuous substitution groups	53
1.3	Recapitulation and completion regarding the discontinuity domains of cyclic groups	54
1.4	The groups of the regular solids and the regular divisions of the elliptic plane.	58
1.5	The division of the ζ -halfplane and the hyperbolic plane belonging to the modular group	62
1.6	Introduction and extension of the Picard group with complex substitution coefficients	64
1.7	The tetrahedral division of the ζ -halfsphere belonging to the Picard group	66
1.8	The discontinuity domain and the generation of the Picard group	70
1.9	Remarks on subgroups of the Picard group. Historical material	73
2	The groups without infinitesimal substitutions and their normal discontinuity domains	79
2.1	The concept of infinitesimal substitutions	79
2.2	The proper discontinuity of the groups without infinitesimal substitutions	81
2.3	Introduction of the concept of the polygon- and the polyhedron-groups	84
2.4	Introduction of the normal discontinuity domains of the projective plane for rotation groups	88
2.5	The vertices and edges of the normal polygons for principal circle groups. First part: the corners in the interior of the ellipse	90
2.6	The vertices and edges of the normal polygons for principal circle groups. Second part: the vertices on and outside the ellipse	94
2.7	The normal polyhedra in the hyperbolic space and their formation in the interior of the sphere	99
2.8	The normal polyhedra on and outside the sphere	101
2.9	The behavior of the polygon groups on the surface of the sphere. First part: General	103
2.10	Continuation: Special consideration of the groups with boundary curves	106
2.11	The normal discontinuity domains for the groups consisting of substitutions of the first and second kinds	111
2.12	Carrying over the normal discontinuity domains onto the ζ -plane and into the ζ -space. Historical material	113
3	Further approaches to the geometrical theory of the properly discontinuous groups	119
3.1	The allowed alteration of the discontinuity domains, in particular for principal circle groups	119
3.2	Continuation: Allowed alteration of the discontinuity domains for polyhedral groups as well as non-principal circle polygon groups	122

3.3	Definition of all groups without infinitesimal substitutions by suitable discontinuity domains. Effectuation in the principal circle case	125
3.4	Continuation: Definition of the polyhedral groups by discontinuity domains	128
3.5	Continuation: General definition of the polygon groups by suitable discontinuity domains	129
3.6	Classification of all groups without infinitesimal substitutions according to the form of the discontinuity domain and the regular divisions arising from these	133
3.7	The generation of the groups and the relations subsisting between the generating substitutions	136
3.8	Continuation: The generators and their relations for polyhedron groups as well as for arbitrary polygon groups	139
3.9	Introduction of the closed resp. partially closed surfaces for polygon groups of the first and second kinds	143
3.10	The canonical discontinuity domains of the polygon groups	146
3.11	The composition of the polygon groups	154
3.12	Introduction of the homogeneous substitutions and groups	157
3.13	The isomorphic splittability of polygon groups without secondary relations	160
3.14	The homogeneous form of the primary relation between the V_i, V_{a_k}, V_{b_k}	163

Part II The geometrical theory of the polygon groups of ζ -substitutions

1	Treatment of the rotation groups on the foundation of the normal discontinuity domains	173
1.1	Disposal of the elliptic rotation groups	173
1.2	The normal hexagon of the parabolic rotation groups	176
1.3	Relation of the normal hexagon of the parabolic rotation groups to the reduction of binary quadratic forms	179
1.4	The parabolic rotation groups with elliptic substitutions	182
1.5	Extension of the parabolic rotation groups by substitutions of the second kind	185
1.6	Continuation: Parabolic rotation groups of the second kind with elliptic substitutions	189
1.7	The non-rotation groups with two boundary points	195
1.8	Extension of the groups with two boundary points by substitutions of the second kind	197
1.9	New explanations concerning the introduction of the normal polygons of the hyperbolic rotation groups	198
1.10	Investigation concerning the cycles of accidental vertices of the normal polygons P_0	203
1.11	Introduction of certain curves of the third order belonging to the substitution-triples V, V', V'' of the accidental vertices	207

1.12	Additional remarks concerning the curves of third order of the triple V, V', V''	210
1.13	The domains Q belonging to the fixed polygon vertices. The reciprocity theorem of the normal polygon	212
1.14	The species concept and the different types of normal polygons of the individual species	215
1.15	The occurrence of special types of the normal polygons of the species (p, n)	219
1.16	The alteration of the normal polygons for monodromy of the centers C_0	222
1.17	The "natural" discontinuity domains of the hyperbolic rotation groups of the first kind	226
2	The canonical polygons and the moduli of the hyperbolic rotation groups ..	233
2.1	Introductory remarks. The canonical polygons of the species $(0, 3)$	234
2.2	The canonical polygons of the species $(1, 1)$ in their first form (as rectilinear quadrangles)	236
2.3	The general form of the canonical polygons for the species $(1, 1)$	240
2.4	The double- n -angle of the species $(0, n)$ and its transformation	245
2.5	Production of the canonical polygons of the species $(0, n)$ from the double- n -angles	250
2.6	The canonical polygons in the case of an arbitrary species (p, n)	254
2.7	Continuation: Elimination of the convex angles possibly arising for the rectilinear canonical polygons of the species (p, n)	258
2.8	Transformation theory of the canonical polygons of an arbitrary species (p, n)	261
2.9	Continuation: The elementary transformations of the third and fourth kinds. Final result	266
2.10	The invariants of substitution pairs V_1, V_2	274
2.11	Introduction of the moduli j_1, j_2, j_3 for the canonical polygons of the species $(0, 3)$	279
2.12	The system of the characteristic conditions for the moduli of the species $(0, 3)$. The manifold of all groups $(0, 3)$	284
2.13	The moduli and their characteristic conditions for the canonical polygons of the species $(1, 1)$. manifold of the groups $(1, 1)$	289
2.14	Introduction of the moduli of the species $(0, n)$. Composition considerations and determinations of sign	295
2.15	Adjunction of the invariants j_{123}, j_{234}, \dots . Relations for the moduli of the species $(0, n)$	298
2.16	The setting up of further conditions valid for the moduli of the species $(0, n)$	302
2.17	Systematic collection and completeness proof of the characteristic conditions for the moduli of the species $(0, n)$	307
2.18	The families of group classes contained in the species $(0, n)$: continuity consideration and existence proof	312
2.19	The characteristic conditions for the moduli and the manifold of all groups of the species (p, n)	314

2.20 The transformation of the systems of moduli and the modular groups of the individual species (p, n) 317

2.21 Special study of the modular transformations for the two species $(0, 4)$ and $(1, 1)$ 320

3 Study of the circular-arc quadrangles without principal circle and remarks on other non-rotation groups 325

2.1 Geometrical derivation of the seven types of circular-arc quadrangles .. 325

2.2 Determination of the seven types of circular-arc quadrangles by their invariants 330

2.3 Preparations for the investigation of the boundary curve for the quadrangle of the first type with four angles zero 335

2.4 Various approximative constructions of the boundary curve for the quadrangle of zero angles 338

2.5 The four kinds of points on the boundary curve G . Course of the boundary curve with respect to parabolic points 340

2.6 Continuation: Course of the boundary curve at hyperbolic and loxodromic places 345

2.7 Description of the quadrangle nets of the second through sixth types .. 348

2.8 Further examples of non-rotation groups of the first and second kinds . 354

Part III Arithmetic methods of definition of properly discontinuous groups of ζ -substitutions

1 The rotation subgroups inside the Picard groups and the associated binary quadratic forms 365

1.1 The Gaussian forms and the modular group 366

1.2 Introduction of the Dirichlet and Hermitian quadratic forms 368

1.3 Geometrical interpretation of the Dirichlet and Hermitian forms 370

1.4 Treatment of the equivalence problem for the definite Hermitian forms 372

1.5 Reduction theory of the Dirichlet forms 374

1.6 The transformation of the Dirichlet forms into themselves 378

1.7 Reduction theory of the indefinite Hermitian forms 380

1.8 The reproducing groups of the indefinite Hermitian forms 383

1.9 The reproducing groups of the Hermitian forms belonging to the determinant $D = 5$ 387

1.10 The reproduction group of the Hermitian forms belonging to the determinant $D = 7$ 393

1.11 Theory of the Gaussian forms in projective-geometrical form 398

1.12 The projective form of the Picard group 401

1.13 Theory of the Hermitian and Dirichlet forms in projective-geometric form 403

2 The reproducing groups of ternary and quaternary quadratic forms 407

2.1 Approach to the groups to be investigated and proper discontinuity of these 407

2.2	Equivalence and commensurability of the reproducing groups Γ_f and Γ_F	409
2.3	Existence proof of the reproducing groups of the ternary forms $f(z_i)$ of both kinds	412
2.4	Existence proof of the reproducing groups of quaternary forms $F(z_i)$..	416
2.5	The occurrence of elliptic and parabolic substitutions in the groups Γ_f and Γ_F	419
2.6	Historical remarks concerning ternary and quaternary forms	420
2.7	Report on Selling's treatment of the ternary quadratic forms	425
2.8	Arithmetic formation law of the ζ -groups Γ_f of the indefinite forms $f(z_i)$	430
2.9	New methods of construction of the discontinuity domain of the individual principal circle group Γ_f	436
2.10	Examples of reproducing groups of real forms $f(z_i)$	441
2.11	Continuation: Groups $[p, q, r]$ incommensurable with the modular group	448
2.12	Arithmetic formation law of the ζ -groups Γ_f for complex ternary forms $f(z_i)$	456
2.13	Examples of reproducing polyhedron groups Γ_f	459
2.14	Arithmetic formation laws for the reproducing groups of quaternary forms $F(z_i)$	466
2.15	Example of a reproducing group Γ_F	470
3	A special kind of principal-circle and polyhedron groups with integral algebraic substitution coefficients	473
3.1	Definition of the groups $[p, q, r]$ for arbitrary number fields Ω	474
3.2	Various extensions of the groups $[p, q, r]$	475
3.3	Lemmas from the theory of units	479
3.4	The discontinuity of the groups $[p, q, r]$ with real substitution coefficients	482
3.5	The discontinuity of the groups $[p, q, r]$ with complex substitution coefficients	487
3.6	Approach to the principal-circle groups of the character (0, 3) to be treated	489
3.7	Discussion of the three conditions for proper discontinuity	491
3.8	The groups $[p, q, r]$ belonging to the signatures (0, 3; 2, l_2, l_3) classified ..	493
3.9	Proof of the identity of the groups (0, 3; 2, l_2, l_3) classified and the arithmetically defined group $[p, q, r]$	497
3.10	Approach to the principal—circle groups of the character (1, 1) to be treated	501
3.11	The groups (1, 1; l) with quadratic fields Ω for $l = 4, 5, 6$	503
3.12	The groups (1, 1; 2) and (1, 1; 3) with quadratic numbers fields Ω	507

Commentaries

1	Commentary by Richard Borchers on Elliptic Modular Functions	515
