Preface	ix
1 Introduction	1
1.1 Ten examples	1
1.2 Inhabitants of space	9
1.3 Challenges	22
2 Enumeration	27
2.1 Hex numbers	27
2.2 Counting calissons	28
2.3 Using cubes to sum integers	29
2.4 Counting cannonballs	35
2.5 Partitioning space with planes	37
2.6 Challenges	40
3 Representation	45
3.1 Numeric cubes as geometric cubes	45
3.2 The inclusion principle and the AM-GM inequality for three numbers	49
3.3 Applications to optimization problems	52
3.4 Inequalities for rectangular boxes	55
3.5 Means for three numbers	59
3.6 Challenges	60
4 Dissection	65
4.1 Parallelepipeds, prisms, and pyramids	65
4.2 The regular tetrahedron and octahedron	67
4.3 The regular dodecahedron	71
4.4 The frustum of a pyramid	72
4.5 The rhombic dodecahedron	74
4.6 The isosceles tetrahedron	76
4.7 The Hadwiger problem	77
4.8 Challenges	79

5	Plane sections	83
5.1	The hexagonal section of a cube	83
5.2	Prismatoids and the prismoidal formula	85
5.3	Cavalieri's principle and its consequences	89
5.4	The right tetrahedron and de Gua's theorem	93
5.5	Inequalities for isosceles tetrahedra	96
5.6	Commandino's theorem	97
5.7	Conic sections	99
5.8	Inscribing the Platonic solids in a sphere	104
5.9	The radius of a sphere	107
5.10	The parallelepiped law	108
5.11	Challenges	110
6	Intersection	117
6.1	Skew lines	118
6.2	Concurrent lines in the plane	119
6.3	Three intersecting cylinders	120
6.4	The area of a spherical triangle	121
6.5	The angles of a tetrahedron	124
6.6	The circumsphere of a tetrahedron	126
6.7	The radius of a sphere, revisited	127
6.8	The sphere as a locus of points	129
6.9	Prince Rupert's cube	130
6.10	Challenges	131
7	Iteration	133
7.1	Is there a four color theorem in space?	133
7.2	Squaring squares and cubing cubes	134
7.3	The Menger sponge and Platonic fractals	136
7.4	Self-similarity and iteration	139
7.5	The Schwarz lantern and the cylinder area paradox	140
7.6	Challenges	143
8	Motion	147
8.1	A million points in space	148
8.2	Viviani's theorem for a regular tetrahedron	149
8.3	Dissecting a cube into identical smaller cubes	152
8.4	Fair division of a cake	153
8.5	From the golden ratio to the plastic number	153
8.6	Hinged dissections and rotations	154

8.7	Euler’s rotation theorem	156
8.8	The conic sections, revisited	157
8.9	Instant Insanity	158
8.10	Challenges	161
9	Projection	165
9.1	Classical projections and their applications	165
9.2	Mapping the earth	169
9.3	Euler’s polyhedral formula	177
9.4	Pythagoras and the sphere	178
9.5	Pythagoras and parallelograms in space	180
9.6	The Loomis-Whitney inequality	182
9.7	An upper bound for the volume of a tetrahedron	184
9.8	Projections in reverse	185
9.9	Hamiltonian cycles in polyhedra	187
9.10	Challenges	189
10	Folding and Unfolding	193
10.1	Polyhedral nets	194
10.2	Deltahedra	196
10.3	Folding a regular pentagon	200
10.4	The Delian problem: duplicating the cube	201
10.5	Surface areas of cylinders, cones, and spheres	203
10.6	Helices	209
10.7	Surface areas of the bicylinder and tricylinder	211
10.8	Folding strange and exotic polyhedra	214
10.9	The spider and the fly	217
10.10	The vertex angles of a tetrahedron	219
10.11	Folding paper in half twelve times	219
10.12	Challenges	222
	Solutions to the Challenges	227
	Chapter 1	227
	Chapter 2	230
	Chapter 3	234
	Chapter 4	237
	Chapter 5	239
	Chapter 6	243
	Chapter 7	245
	Chapter 8	246

Chapter 9	249
Chapter 10	253
References	259
Index	265
About the Authors	272
