Preface	xi
Part 1. Transport processes: the basic prototypes	
Chapter 1. Convection	3
Material volumes and transport theorem	3
Problem 1.1: Convection along a one-dimensional line	5
Problem 1.2: Jacobian of flow map	6
Problem 1.3: Transport theorem by change of variable	8
Problem 1.4: Time derivative of integral over a changing region	9
The convection PDE	10
Problem 1.5: Density carried by incompressible flow	10
Problem 1.6: Transformation of velocities as a flow map	11
Convective flux and boundary conditions	12
Elastic rebounds from a moving wall	13
Problem 1.7: Adiabatic expansion of particles in a box I	15
Problem 1.8: Adiabatic expansion of particles in a box II	15
Problem 1.9: Adiabatic expansion of particles in a box III	16
Problem 1.10: Adiabatic expansion of particles in a box IV	17
Convective derivative	18
Convected scalars	19
Problem 1.11: A convected scalar	19
Gradient of a convected scalar	20
Problem 1.12: Flows that preserve gradients	22
Problem 1.13: Vector analog of a convected scalar	24
Problem 1.14: Vector analogs of a convected density	25
Geometric postscript	29

Guide to bibliography	30
Chapter 2. Diffusion	31
Brownian motion	31
The diffusion PDE	33
Problem 2.1: Lattice random walk model of diffusion I	35
Problem 2.2: Lattice random walk model of diffusion II	36
Problem 2.3: Lattice random walk model of diffusion III	37
Problem 2.4: Lattice random walk model of diffusion IV	38
Problem 2.5: Lattice random walk model of diffusion V	38
Diffusion in \mathbb{R}^n	39
Fick's law	39
Problem 2.6: Lyapunov functional for a diffusion process	40
Problem 2.7: The Maxwell flux	41
Problem 2.8: Steady state in two dimensions?	42
Melting interfaces	42
Problem 2.9: Nonlinear free boundary problem I	45
Problem 2.10: Nonlinear free boundary problem II	46
Problem 2.11: Nonlinear free boundary problem III	47
Problem 2.12: Nonlinear free boundary problem IV	48
The diffusion kernel	49
Scale invariance of the diffusion kernel	50
Problem 2.13: \mathbb{R}^2 diffusion kernel from symmetry and independence	53
Problem 2.14: Similarity solution for melting interfaces	54
Problem 2.15: Source of Brownian particles in two dimensions	56
Problem 2.16: Homogeneous harmonic function in a wedge	58
Guide to bibliography	59
Chapter 3. Local conservation laws	61
Definition	61
Convection-diffusion	61
Problem 3.1: A "dissolving" interface	62
Smoluchowski boundary value problem	65
Problem 3.2: Time-independent equilibria	67
Problem 3.3: Entropy functional	68
Problem 3.4: Free energy decreases	70
Problem 3.5: Equilibrium or nonequilibrium in Coulomb potential	70
Locality	72
Sources	75
The steady diffusion flame	76
Problem 3.6: Absorbing boundary condition for diffusion	80
Problem 3.7: An "evaporation" interface driven by chemical reaction	82

Guide to bibliography	84
Part 2. Superposition	
Chapter 4. Superposition of point source solutions	87
One space dimension	87
Problem 4.1: Soviet rod factory	89
Three space dimensions	91
Problem 4.2: Superposition solution by Green's identity	93
Problem 4.3: The smoke plume	94
Problem 4.4: Far downstream limit	96
Sources in spacetime	98
Problem 4.5: Moving source	101
The hottest time of the day	102
Problem 4.6: "Diffusive" damping	105
Problem 4.7: Work against "diffusive friction"	107
Problem 4.8: Oscillatory point source solution in \mathbb{R}^3 and descent to \mathbb{R}^2	109
Problem 4.9: Direct analysis of the \mathbb{R}^2 integral representation	111
Guide to bibliography	113
Chapter 5. δ -functions	115
δ -functions as "shorthand"	116
Problem 5.1: Correctly representing a point load	118
Problem 5.2: Correlation function of colored noise	120
Problem 5.3: A primer on polarized media	125
Problem 5.4: Exit times for Brownian motion	128
δ -sequences	130
Problem 5.5: Green's identity and inhomogeneous diffusion PDEs	132
"Oscillatory" δ -sequences	134
Problem 5.6: Cancellation by oscillation	136
Problem 5.7: An oscillatory δ -sequence	138
Guide to bibliography	140
Part 3. Scaling-based reductions in basic fluid mechanics	
Chapter 6. Ideal fluid mechanics	143
Ideal fluid	143
Problem 6.1: Tornado season	147
Problem 6.2: Ideal gas equation of state	148
Problem 6.3: Bernoulli's theorem and flying over Dagoba	150
Problem 6.4: Circulation and vorticity	152
Problem 6.5: Heating due to shock wave	153

Stable rest state of ideal fluid	157
Finite propagation speed and wavefronts	158
Problem 6.6: Sonic boom	160
Incompressible fluid	165
Problem 6.7: Two-dimensional vortex dynamics	166
Problem 6.8: The “ground effect”	169
Problem 6.9: Elliptical vortices	172
The incompressible limit of compressible flow	176
Problem 6.10: Buoyancy force	178
Problem 6.11: Internal waves	181
Guide to bibliography	184
Chapter 7. Free surface waves	187
Basic equations	187
Linearized waves	189
Plane waves and the dispersion relation	190
Problem 7.1: Internal waves, again	193
Shallow water equations	197
Problem 7.2: Variable-depth ocean and “slow currents”	200
Problem 7.3: What bottom topography does to vortices	202
Problem 7.4: A cautionary tale about point vortices	204
Guide to bibliography	207
Chapter 8. Solution of the shallow water equations	209
Simple waves	209
Problem 8.1: Simple waves in ideal fluid	212
Problem 8.2: Longitudinal elastic waves	215
Characteristics and Riemann invariants	219
Problem 8.3: Characteristics and Riemann invariants for elastic waves	222
Problem 8.4: Beginning of a tsunami	224
Dam break problem	227
Problem 8.5: Wave generator	228
Bores	231
Problem 8.6: “Potential energy” in shallow water theory	234
Problem 8.7: Elastic shocks	235
Characteristics “eaten” by a bore	238
The afterlife of a simple wave	239
Propagation of a weak bore	240
Problem 8.8: Area rule for Burger’s shocks	242
Problem 8.9: Traveling waves in variable-depth ocean	246
Problem 8.10: Tsunami reveals its true self	251
Guide to bibliography	255

Bibliography	257
Index	259
