Preface	xiii
Chapter 1. Inner Product Spaces	1
§1.1. Inner Products	3
§1.2. Orthogonality	6
§1.3. The Trigonometric System	10
Exercises	11
Chapter 2. Normed Spaces	15
§2.1. The Cauchy–Schwarz Inequality and the Space ℓ^2	15
§2.2. Norms	18
§2.3. Bounded Linear Mappings	21
§2.4. Basic Examples	23
§2.5. *The ℓ^p -Spaces ($1 \leq p < \infty$)	28
Exercises	31
Chapter 3. Distance and Approximation	37
§3.1. Metric Spaces	37
§3.2. Convergence	39
§3.3. Uniform, Pointwise and (Square) Mean Convergence	41
§3.4. The Closure of a Subset	47
Exercises	50
Chapter 4. Continuity and Compactness	55
§4.1. Open and Closed Sets	55

§4.2. Continuity	58
§4.3. Sequential Compactness	64
§4.4. Equivalence of Norms	66
§4.5. *Separability and General Compactness	71
Exercises	74
Chapter 5. Banach Spaces	79
§5.1. Cauchy Sequences and Completeness	79
§5.2. Hilbert Spaces	81
§5.3. Banach Spaces	84
§5.4. Series in Banach Spaces	86
Exercises	88
Chapter 6. *The Contraction Principle	93
§6.1. Banach's Contraction Principle	94
§6.2. Application: Ordinary Differential Equations	95
§6.3. Application: Google's PageRank	98
§6.4. Application: The Inverse Mapping Theorem	100
Exercises	104
Chapter 7. The Lebesgue Spaces	107
§7.1. The Lebesgue Measure	110
§7.2. The Lebesgue Integral and the Space $L^1(X)$	113
§7.3. Null Sets	115
§7.4. The Dominated Convergence Theorem	118
§7.5. The Spaces $L^p(X)$ with $1 \leq p \leq \infty$	121
Advice for the Reader	125
Exercises	126
Chapter 8. Hilbert Space Fundamentals	129
§8.1. Best Approximations	129
§8.2. Orthogonal Projections	133
§8.3. The Riesz–Fréchet Theorem	135
§8.4. Orthogonal Series and Abstract Fourier Expansions	137
Exercises	141
Chapter 9. Approximation Theory and Fourier Analysis	147
§9.1. Lebesgue's Proof of Weierstrass' Theorem	149

§9.2. Truncation	151
§9.3. Classical Fourier Series	156
§9.4. Fourier Coefficients of L^1 -Functions	161
§9.5. The Riemann–Lebesgue Lemma	162
§9.6. *The Strong Convergence Lemma and Fejér’s Theorem	164
§9.7. *Extension of a Bounded Linear Mapping	168
Exercises	172
Chapter 10. Sobolev Spaces and the Poisson Problem	177
§10.1. Weak Derivatives	177
§10.2. The Fundamental Theorem of Calculus	179
§10.3. Sobolev Spaces	182
§10.4. The Variational Method for the Poisson Problem	184
§10.5. *Poisson’s Problem in Higher Dimensions	187
Exercises	188
Chapter 11. Operator Theory I	193
§11.1. Integral Operators and Fubini’s Theorem	193
§11.2. The Dirichlet Laplacian and Hilbert–Schmidt Operators	196
§11.3. Approximation of Operators	199
§11.4. The Neumann Series	202
Exercises	205
Chapter 12. Operator Theory II	211
§12.1. Compact Operators	211
§12.2. Adjoints of Hilbert Space Operators	216
§12.3. *The Lax–Milgram Theorem	219
§12.4. *Abstract Hilbert–Schmidt Operators	221
Exercises	226
Chapter 13. Spectral Theory of Compact Self-Adjoint Operators	231
§13.1. Approximate Eigenvalues	231
§13.2. Self-Adjoint Operators	234
§13.3. The Spectral Theorem	236
§13.4. *The General Spectral Theorem	240
Exercises	241
Chapter 14. Applications of the Spectral Theorem	247

§14.1. The Dirichlet Laplacian	247
§14.2. The Schrödinger Operator	249
§14.3. An Evolution Equation	252
§14.4. *The Norm of the Integration Operator	254
§14.5. *The Best Constant in the Poincaré Inequality	256
Exercises	257
Chapter 15. Baire's Theorem and Its Consequences	261
§15.1. Baire's Theorem	261
§15.2. The Uniform Boundedness Principle	263
§15.3. Nonconvergence of Fourier Series	266
§15.4. The Open Mapping Theorem	267
§15.5. Applications with a Look Back	271
Exercises	274
Chapter 16. Duality and the Hahn–Banach Theorem	277
§16.1. Extending Linear Functionals	278
§16.2. Elementary Duality Theory	284
§16.3. Identification of Dual Spaces	289
§16.4. *The Riesz Representation Theorem	295
Exercises	299
Historical Remarks	305
Appendix A. Background	311
§A.1. Sequences and Subsequences	311
§A.2. Equivalence Relations	312
§A.3. Ordered Sets	314
§A.4. Countable and Uncountable Sets	316
§A.5. Real Numbers	316
§A.6. Complex Numbers	321
§A.7. Linear Algebra	322
§A.8. Set-theoretic Notions	329
Appendix B. The Completion of a Metric Space	333
§B.1. Uniqueness of a Completion	334
§B.2. Existence of a Completion	335
§B.3. The Completion of a Normed Space	337

Exercises	338
Appendix C. Bernstein's Proof of Weierstrass' Theorem	339
Appendix D. Smooth Cutoff Functions	343
Appendix E. Some Topics from Fourier Analysis	345
§E.1. Plancherel's Identity	346
§E.2. The Fourier Inversion Formula	347
§E.3. The Carlson–Beurling Inequality	348
Exercises	349
Appendix F. General Orthonormal Systems	351
§F.1. Unconditional Convergence	351
§F.2. Uncountable Orthonormal Bases	353
Bibliography	355
Symbol Index	359
Subject Index	361
Author Index	371
