Preface	xi
Part I. Large deviations: General theory and i.i.d. processes	
Chapter 1. Introductory discussion	3
§1.1. Information-theoretic entropy	5
§1.2. Thermodynamic entropy	8
§1.3. Large deviations as useful estimates	12
Chapter 2. The large deviation principle	17
§2.1. Precise asymptotics on an exponential scale	17
§2.2. Lower semicontinuous and tight rate functions	20
§2.3. Weak large deviation principle	23
§2.4. Aspects of Cramér's theorem	26
§2.5. Limits, deviations, and fluctuations	33
Chapter 3. Large deviations and asymptotics of integrals	35
§3.1. Contraction principle	35
§3.2. Varadhan's theorem	37
§3.3. Bryc's theorem	41
§3.4. Curie-Weiss model of ferromagnetism	43
Chapter 4. Convex analysis in large deviation theory	49
§4.1. Some elementary convex analysis	49
§4.2. Rate function as a convex conjugate	58
§4.3. Multidimensional Cramér theorem	61

Chapter 5. Relative entropy and large deviations for empirical measures	67
§5.1. Relative entropy	67
§5.2. Sanov's theorem	73
§5.3. Maximum entropy principle	78
Chapter 6. Process level large deviations for i.i.d. fields	83
§6.1. Setting	83
§6.2. Specific relative entropy	85
§6.3. Pressure and the large deviation principle	91
 Part II. Statistical mechanics	
Chapter 7. Formalism for classical lattice systems	99
§7.1. Finite-volume model	99
§7.2. Potentials and Hamiltonians	101
§7.3. Specifications	103
§7.4. Phase transition	108
§7.5. Extreme Gibbs measures	110
§7.6. Uniqueness for small potentials	112
Chapter 8. Large deviations and equilibrium statistical mechanics	121
§8.1. Thermodynamic limit of the pressure	121
§8.2. Entropy and large deviations under Gibbs measures	124
§8.3. Dobrushin-Lanford-Ruelle (DLR) variational principle	127
Chapter 9. Phase transition in the Ising model	133
§9.1. One-dimensional Ising model	136
§9.2. Phase transition at low temperature	138
§9.3. Case of no external field	141
§9.4. Case of nonzero external field	146
Chapter 10. Percolation approach to phase transition	149
§10.1. Bernoulli bond percolation and random cluster measures	149
§10.2. Ising phase transition revisited	153

Part III. Additional large deviation topics

Chapter 11. Further asymptotics for i.i.d. random variables	161
§11.1. Refinement of Cramér's theorem	161
§11.2. Moderate deviations	164
Chapter 12. Large deviations through the limiting generating function	167
§12.1. Essential smoothness and exposed points	167
§12.2. Gärtner-Ellis theorem	175
§12.3. Large deviations for the current of particles	179
Chapter 13. Large deviations for Markov chains	187
§13.1. Relative entropy for kernels	187
§13.2. Countable Markov chains	191
§13.3. Finite Markov chains	203
Chapter 14. Convexity criterion for large deviations	213
Chapter 15. Nonstationary independent variables	221
§15.1. Generalization of relative entropy and Sanov's theorem	221
§15.2. Proof of the large deviation principle	223
Chapter 16. Random walk in a dynamical random environment	233
§16.1. Quenched large deviation principles	234
§16.2. Proofs via the Baxter-Jain theorem	239

Appendixes

Appendix A. Analysis	259
§A.1. Metric spaces and topology	259
§A.2. Measure and integral	262
§A.3. Product spaces	267
§A.4. Separation theorem	268
§A.5. Minimax theorem	269

Appendix B. Probability	273
§B.1. Independence	274
§B.2. Existence of stochastic processes	275
§B.3. Conditional expectation	276
§B.4. Weak topology of probability measures	278
§B.5. First limit theorems	282
§B.6. Ergodic theory	282
§B.7. Stochastic ordering	288
Appendix C. Inequalities from statistical mechanics	293
§C.1. Griffiths's inequality	293
§C.2. Griffiths-Hurst-Sherman inequality	294
Appendix D. Nonnegative matrices	297
Bibliography	299
Notation index	305
Author index	311
General index	313
