Preface	xi
Chapter 1. Introduction to viscosity solutions for Hamilton–Jacobi equations	1
§1.1. Introduction	1
§1.2. Vanishing viscosity method for first-order Hamilton–Jacobi equations	5
§1.3. Existence of viscosity solutions via the vanishing viscosity method	12
§1.4. Consistency and stability of viscosity solutions	15
§1.5. The comparison principle and uniqueness result for static problems	16
§1.6. The comparison principle and uniqueness result for Cauchy problems	21
§1.7. Introduction to the classical Bernstein method	25
§1.8. Introduction to Perron’s method	28
§1.9. Lipschitz estimates for Cauchy problems using Perron’s method	34
§1.10. Finite speed of propagation for Cauchy problems	36
§1.11. Rate of convergence of the vanishing viscosity process for static problems via the doubling variables method	38
§1.12. Rate of convergence of the vanishing viscosity process for static problems via the nonlinear adjoint method	42
§1.13. References	47

---

Chapter 2. First-order Hamilton–Jacobi equations with convex Hamiltonians	51
§2.1. Introduction to the optimal control theory	51
§2.2. Dynamic Programming Principle	54
§2.3. Static Hamilton–Jacobi equation for the value function	57
§2.4. Legendre’s transform	60
§2.5. The optimal control formula from the Lagrangian viewpoint	63
§2.6. A further hidden structure of convex first-order Hamilton–Jacobi equations	70
§2.7. Maximal subsolutions and their representation formulas	77
§2.8. References	87
Chapter 3. First-order Hamilton–Jacobi equations with possibly nonconvex Hamiltonians	89
§3.1. Introduction to two-player zero-sum differential games	89
§3.2. Representation formulas of solutions of Hamilton–Jacobi equations	98
§3.3. The Hopf formula	101
§3.4. Finite difference approximations	104
§3.5. References	108
Chapter 4. Periodic homogenization theory for Hamilton–Jacobi equations	109
§4.1. Introduction to periodic homogenization theory	109
§4.2. Cell problems and periodic homogenization of static Hamilton–Jacobi equations	113
§4.3. Periodic homogenization for Cauchy problems	117
§4.4. Some first properties of the effective Hamiltonian	121
§4.5. Further properties of the effective Hamiltonian in the convex setting	126
§4.6. Some representation formulas of the effective Hamiltonian in nonconvex settings	136
§4.7. Rates of convergence	152
§4.8. Nonuniqueness of solutions to the cell problems	158
§4.9. References	161

---

Chapter 5. Almost periodic homogenization theory for Hamilton–Jacobi equations	163
§5.1. Introduction to almost periodic homogenization theory	163
§5.2. Vanishing discount problems and identification of the effective Hamiltonian	166
§5.3. Nonexistence of sublinear correctors	168
§5.4. Homogenization for Cauchy problems	170
§5.5. Properties of the effective Hamiltonians	172
§5.6. References	176
Chapter 6. First-order convex Hamilton–Jacobi equations in a torus	177
§6.1. New representation formulas for solutions of the discount problems	177
§6.2. New representation formula for the effective Hamiltonian and applications	182
§6.3. Cell problems, backward characteristics, and applications	188
§6.4. Optimal rate of convergence in periodic homogenization theory	194
§6.5. Equivalent characterizations of Lipschitz viscosity subsolutions	202
§6.6. References	204
Chapter 7. Introduction to weak KAM theory	207
§7.1. Introduction	207
§7.2. Lagrangian methods in weak KAM theory	209
§7.3. Mather measures and Mather set	215
§7.4. Nonlinear PDE methods in weak KAM theory	223
§7.5. The projected Aubry set	233
§7.6. References	244
Chapter 8. Further properties of the effective Hamiltonians in the convex setting	247
§8.1. Strict convexity of the effective Hamiltonian in certain directions	247
§8.2. Asymptotic expansion at infinity	250
§8.3. The classical Hedlund example	254
§8.4. A generalization of the classical Hedlund example	256
§8.5. References	259

---

Appendix A. Notations	261
§A.1. Notation for sets and spaces	261
§A.2. Notation for functions	262
§A.3. Notation for function spaces	264
§A.4. Notation for estimates	265
Appendix B. Sion's minimax theorem	267
Appendix C. Characterization of the Legendre transform	271
§C.1. Preliminaries	272
§C.2. Affine functions and delta type functions	274
Appendix D. Existence and regularity of minimizers for action functionals	277
§D.1. Existence of minimizers	278
§D.2. Regularity of minimizers	281
Appendix E. Boundary value problems	283
§E.1. State-constraint problems	284
§E.2. Dirichlet problems	286
§E.3. Neumann problems	287
Appendix F. Sup-convolutions	289
Appendix G. Sketch of proof of Theorem 6.26	293
Appendix H. Solutions to some exercises	297
Bibliography	311
Index	319
