Preface	ix
§0.1. “Real world” landscape as of 2024	x
§0.2. Usage	xi
§0.3. Acknowledgments	xi
§0.4. Notation	xii
Chapter 1. Classical and probabilistic computation	1
§1.1. Complexity of various tasks	1
§1.2. Surprising algorithms	3
§1.3. Classical computation via circuits	11
§1.4. Reversible classical computation	13
§1.5. Classical computation via linear algebra	14
§1.6. Probabilistic computation via linear algebra	16
§1.7. Brief overview of classical, probabilistic, and quantum complexity classes	18
Chapter 2. Quantum mechanics for quantum computation	23
§2.1. “Improved” probability and the linear algebra associated to it	23
§2.2. Experimental origins of quantum mechanics	29
§2.3. Postulates of quantum mechanics	30
§2.4. Super-dense coding	35
§2.5. Quantum teleportation	36
§2.6. Bell’s game	37

Chapter 3. Algorithms	41
§3.1. Grover's search algorithm	41
§3.2. Simon's algorithm	44
§3.3. Elementary number theory needed for the algorithms of Miller-Rabin and Shor	47
§3.4. Primality testing: The Miller-Rabin algorithm	51
§3.5. Quantum gate sets	55
§3.6. Shor's algorithm	59
Chapter 4. Classical information theory	77
§4.1. Data compression: Noiseless channels	78
§4.2. Preliminary solution to the compression problem	80
§4.3. Entropy, i.e., uncertainty	82
§4.4. Shannon's noiseless channel theorem	87
§4.5. Transmission over noisy channels	90
Chapter 5. Language and background material for quantum information theory	99
§5.1. Reformulation of the postulates of quantum mechanics	99
§5.2. Remarks on, and first consequences of, the reformulation	104
§5.3. Distances between density operators	110
§5.4. Singular value and polar decompositions	110
§5.5. Quantum channels	112
Chapter 6. Quantum information	121
§6.1. The quantum noiseless channel theorem	121
§6.2. Properties of von Neumann entropy	125
§6.3. Conditional von Neumann entropy and strong subadditivity	134
§6.4. Information-theoretic consequences of strong subadditivity	139
§6.5. Entanglement and LOCC	142
§6.6. Entanglement distillation and dilution	149
Chapter 7. Representation theory and quantum information	155
§7.1. Representation theory	156
§7.2. Schur-Weyl duality and $\epsilon$ -typical subspaces	163
§7.3. The quantum marginal problem	166
§7.4. Tripartite states	174
§7.5. Proof that $\text{Kron}_{m,n,k}$ is finitely generated and monotonicity of Kronecker coefficients	178

---

Appendix A. Algebra and linear algebra	181
§A.1. Groups and rings	181
§A.2. Linear and multilinear algebra	183
Appendix B. Probability	185
§B.1. Probability distributions and marginals	185
§B.2. Expectation and variance	186
§B.3. The law of large numbers	187
§B.4. Joint probability distributions and conditional probability	188
Hints and answers to selected exercises	189
Bibliography	195
Index	201
