Preface	xiii
Part 1. Fundamentals	
Chapter 0. Themes of Asymptotic Analysis	3
§0.1. Theme: Asymptotics, Convergent and Divergent Asymptotic Series	3
§0.2. Theme: Other Parameters and Nonuniformity	8
0.2.1. First example. Oscillations	8
0.2.2. Second example. Boundary layers	10
§0.3. Theme: Differential Equations	12
§0.4. Theme: Universal Partial Differential Equations and Canonical Physical Models	13
Chapter 1. The Nature of Asymptotic Approximations	15
§1.1. Asymptotic Approximations and Errors	15
1.1.1. Order relations among functions	15
1.1.2. Statements following from the order relations	20
1.1.3. Absolute and relative errors	23
§1.2. Convergent versus Asymptotic Series: Concepts	24
1.2.1. Convergent power series	24
1.2.2. Introduction to asymptotic series	26
§1.3. Asymptotic Sequences and Series: General Definitions	28
§1.4. How to “Sum” an Asymptotic Series	32
§1.5. Asymptotic Root Finding	36
1.5.1. A regular perturbation problem	38

1.5.2. A singular perturbation problem. Rescaling and the principle of dominant balance	40
§1.6. Notes and References	43
Part 2. Asymptotic Analysis of Exponential Integrals	
Chapter 2. Fundamental Techniques for Integrals	47
§2.1. Review of Basic Methods	47
§2.2. Exponential Integrals and Watson's Lemma	52
§2.3. Elementary Generalizations of Watson's Lemma	56
Chapter 3. Laplace's Method for Asymptotic Expansions of Integrals	61
§3.1. Introduction	61
§3.2. Nonlocal Contributions	62
§3.3. Contributions from Endpoints	64
§3.4. Contributions from Interior Maxima	67
§3.5. Summary of Generic Leading-order Behavior	70
§3.6. Application: Weakly Diffusive Regularization of Shock Waves	73
3.6.1. The method of characteristics	75
3.6.2. Regularization of shocks by diffusion. Burgers' equation	78
3.6.3. The Cole-Hopf transformation and the solution of the initial-value problem for Burgers' equation	80
3.6.4. Analysis of the solution in the limit of vanishing diffusion	82
§3.7. Multidimensional Integrals	87
§3.8. Notes and References	93
Chapter 4. The Method of Steepest Descents for Asymptotic Expansions of Integrals	95
§4.1. Introduction	95
§4.2. Contour Deformation	97
§4.3. Paths of Steepest Descent	98
§4.4. Saddle Points	103
§4.5. Parametrization-independent Local Contributions	107
§4.6. Application: Long-time Asymptotic Behavior of Diffusion Processes	108
4.6.1. A derivation of the diffusion equation	109

4.6.2. Solution of the diffusion equation and the corresponding initial-value problem	110
4.6.3. Long-time asymptotics via the method of steepest descents	112
§4.7. Application: Asymptotic Behavior of Special Functions, Airy Functions and the Stokes Phenomenon	116
4.7.1. Integral representations for Airy functions	116
4.7.2. Preliminary transformations necessary for asymptotic analysis of $Ai(x)$ for large x	117
4.7.3. Determination of the path. Dependence of the path on κ	119
4.7.4. Asymptotic behavior of $Ai(x)$ for large x . The Stokes phenomenon	122
§4.8. The Effect of Branch Points	125
4.8.1. Application: Asymptotics of transform integrals	135
4.8.2. Application: Selection of particular solutions of linear differential equations admitting integral representations	142
§4.9. Notes and References	147
Chapter 5. The Method of Stationary Phase for Asymptotic Analysis of Oscillatory Integrals	149
§5.1. Introduction	149
§5.2. Nonlocal Contributions	151
§5.3. Contributions from Interior Stationary Phase Points	156
5.3.1. Putting the exponent in normal form by a change of variables	156
5.3.2. Analysis of $J_1(\lambda)$ by the method of steepest descents	158
5.3.3. Analysis of $J_2(\lambda)$ using integration by parts	160
5.3.4. The asymptotic contribution of a stationary phase point	161
§5.4. Summary of Generic Leading-order Behavior	162
§5.5. Application: Long-time Behavior of Linear Dispersive Waves	164
5.5.1. Partial differential equations for linear dispersive waves	164
5.5.2. Analysis of the solution formula. Long-time asymptotics using the method of stationary phase	167
5.5.3. Structure of the wave field for large time. Modulated wavetrains and group velocity	169
§5.6. Application: Semiclassical Dynamics of Free Particles in Quantum Mechanics	171
5.6.1. Derivation of the dispersion relation for “matter waves”	171

5.6.2. The Schrödinger equation for a free particle.	
Interpretation of the Schrödinger wave function	173
5.6.3. The semiclassical limit. Heuristic reasoning	174
5.6.4. Rigorous semiclassical asymptotics using the method of stationary phase	177
§5.7. Multidimensional Integrals	181
§5.8. Notes and References	193
Part 3. Asymptotic Analysis of Differential Equations	
Chapter 6. Asymptotic Behavior of Solutions of Linear Second-order Differential Equations in the Complex Plane	197
§6.1. Qualitative Theory of Solutions	198
6.1.1. Reduction to canonical form	198
6.1.2. Solutions viewed as analytic functions of the complex variable z	200
6.1.3. Reduction of order	213
§6.2. Asymptotic Behavior near Ordinary and Regular Singular Points	214
6.2.1. Series solutions at ordinary points	215
6.2.2. Series solutions at regular singular points. The method of Frobenius	216
§6.3. Asymptotic Behavior near Irregular Singular Points	223
6.3.1. Formal asymptotic series	223
6.3.2. Existence of true solutions described by the formal asymptotic series. The Stokes phenomenon	229
6.3.3. Another approach to the existence of true solutions and the Stokes phenomenon. Borel summation	246
§6.4. Notes and References	251
Chapter 7. Introduction to Asymptotics of Solutions of Ordinary Differential Equations with Respect to Parameters	253
§7.1. Regular Perturbation Problems	254
7.1.1. Formal power series expansions	255
7.1.2. Solving for $y_n(x)$. Variation of parameters	256
7.1.3. Justification of the formal expansion	260
§7.2. Singular Asymptotics	263
7.2.1. The WKB method	263
7.2.2. The special case of an asymptotic power series for $f(x; \lambda)$	268
7.2.3. Turning points	277

7.2.4. Problems with more than one turning point. The Bohr-Sommerfeld quantization rule	300
7.2.5. Uniform asymptotics near turning points. Langer transformations	304
§7.3. Notes and References	310
Chapter 8. Asymptotics of Linear Boundary-value Problems	311
§8.1. Asymptotic Existence of Solutions	312
8.1.1. Case I: $a(x) \neq 0$ on $[\alpha, \beta]$ and ϵ is positive but sufficiently small	314
8.1.2. Case II: $b(x) - a'(x)/2 \leq 0$ on $[\alpha, \beta]$ and ϵ is positive	314
§8.2. An Exactly Solvable Boundary-value Problem: Phenomenology of Boundary Layers	315
§8.3. Outer Asymptotics	318
§8.4. Rescaling and Inner Asymptotics for Boundary Layers and Internal Layers	321
§8.5. Matching of Asymptotic Expansions, Intermediate Variables, and Uniformly Valid Asymptotics	325
§8.6. Examples	328
§8.7. Proving the Validity of Uniform Approximations	342
§8.8. The Method of Multiple Scales	350
§8.9. Notes and References	353
Chapter 9. Asymptotics of Oscillatory Phenomena	355
§9.1. Perturbation Theory in Linear Algebra and Eigenvalue Problems	356
9.1.1. Nondegenerate theory	357
9.1.2. Degenerate theory	362
9.1.3. More on solvability conditions. Inner products and adjoints	365
§9.2. Periodic Boundary Conditions and Mathieu's Equation	368
9.2.1. Floquet theory	368
9.2.2. Periodic and antiperiodic solutions. Formal asymptotics	371
9.2.3. Justification of the expansions	377
§9.3. Weakly Nonlinear Oscillations	382
9.3.1. Periodic solutions near equilibrium	383
9.3.2. A perturbative approach to weak cubic nonlinearity. Secular terms	384
9.3.3. Removal of secular terms. Strained coordinates and the Poincaré-Lindstedt method	388

9.3.4. The method of multiple scales	391
9.3.5. Justification of the expansions	397
§9.4. Notes and References	400
Chapter 10. Weakly Nonlinear Waves	401
§10.1. Derivation of Universal Partial Differential Equations Using the Method of Multiple Scales	401
10.1.1. Modulated wavetrains with dispersion and nonlinear effects. The cubic nonlinear Schrödinger equation	402
10.1.2. Spontaneous excitation of a mean flow	410
10.1.3. Multiple wave resonances	417
10.1.4. Long wave asymptotics. The Boussinesq equation and the Korteweg-de Vries equation	423
§10.2. Waves in Molecular Chains	425
10.2.1. The Fermi-Pasta-Ulam model	426
10.2.2. Derivation of the cubic nonlinear Schrödinger equation	427
10.2.3. Derivation of the Boussinesq and Korteweg- de Vries equations	432
§10.3. Water Waves	433
10.3.1. Derivation of the cubic nonlinear Schrödinger equation	436
10.3.2. Derivation of the Korteweg-de Vries equation	444
§10.4. Notes and References	447
Appendix: Fundamental Inequalities	451
Triangle Inequalities	451
Minkowski Inequalities	452
Hölder Inequalities	452
Bibliography	453
Index of Names	455
Subject Index	457
