Preface	xiii
<b>Part 1. Foundations</b>	
Chapter 1. Classical Mechanics	3
§1. Lagrangian Mechanics	4
1.1. Generalized coordinates	4
1.2. The principle of the least action	4
1.3. Examples of Lagrangian systems	8
1.4. Symmetries and Noether's theorem	15
1.5. One-dimensional motion	20
1.6. The motion in a central field and the Kepler problem	22
1.7. Legendre transform	26
§2. Hamiltonian Mechanics	31
2.1. Hamilton's equations	31
2.2. The action functional in the phase space	33
2.3. The action as a function of coordinates	35
2.4. Classical observables and Poisson bracket	38
2.5. Canonical transformations and generating functions	39
2.6. Symplectic manifolds	42
2.7. Poisson manifolds	51
2.8. Hamilton's and Liouville's representations	56
§3. Notes and references	60
Chapter 2. Basic Principles of Quantum Mechanics	63
§1. Observables, states, and dynamics	65
1.1. Mathematical formulation	66

---

1.2. Heisenberg's uncertainty relations	74
1.3. Dynamics	75
§2. Quantization	79
2.1. Heisenberg commutation relations	80
2.2. Coordinate and momentum representations	86
2.3. Free quantum particle	93
2.4. Examples of quantum systems	98
2.5. Old quantum mechanics	102
2.6. Harmonic oscillator	103
2.7. Holomorphic representation and Wick symbols	111
§3. Weyl relations	118
3.1. Stone-von Neumann theorem	119
3.2. Invariant formulation	125
3.3. Weyl quantization	128
3.4. The $\star$ -product	136
3.5. Deformation quantization	139
§4. Notes and references	146
Chapter 3. Schrödinger Equation	149
§1. General properties	149
1.1. Self-adjointness	150
1.2. Characterization of the spectrum	152
1.3. The virial theorem	154
§2. One-dimensional Schrödinger equation	155
2.1. Jost functions and transition coefficients	155
2.2. Eigenfunction expansion	163
2.3. $S$ -matrix and scattering theory	170
2.4. Other boundary conditions	177
§3. Angular momentum and $SO(3)$	180
3.1. Angular momentum operators	180
3.2. Representation theory of $SO(3)$	182
§4. Two-body problem	185
4.1. Separation of the center of mass	185
4.2. Three-dimensional scattering theory	186
4.3. Particle in a central potential	188
§5. Hydrogen atom and $SO(4)$	193
5.1. Discrete spectrum	193
5.2. Continuous spectrum	197
5.3. Hidden $SO(4)$ symmetry	199
§6. Semi-classical asymptotics – I	205
6.1. Time-dependent asymptotics	206

---

6.2. Time independent asymptotics	209
6.3. Bohr-Wilson-Sommerfeld quantization rules	212
§7. Notes and references	213
Chapter 4. Spin and Identical Particles	217
§1. Spin	217
1.1. Spin operators	217
1.2. Spin and representation theory of $SU(2)$	218
§2. Charged spin particle in the magnetic field	221
2.1. Pauli Hamiltonian	221
2.2. Particle in a uniform magnetic field	223
§3. System of identical particles	224
3.1. The symmetrization postulate	225
3.2. Young diagrams and representation theory of $Sym_N$	229
3.3. Schur-Weyl duality and symmetry of the wave functions	232
§4. Notes and references	234
<b>Part 2. Functional Methods and Supersymmetry</b>	
Chapter 5. Path Integral Formulation of Quantum Mechanics	239
§1. Feynman path integral	239
1.1. The fundamental solution of the Schrödinger equation	239
1.2. Feynman path integral in the phase space	242
1.3. Feynman path integral in the configuration space	245
1.4. Several degrees of freedom	247
§2. Symbols of the evolution operator and path integrals	249
2.1. The $pq$ -symbol	249
2.2. The $qp$ -symbol	250
2.3. The Weyl symbol	251
2.4. The Wick symbol	252
§3. Feynman path integral for the harmonic oscillator	255
3.1. Gaussian integration	255
3.2. Propagator of the harmonic oscillator	257
3.3. Mehler identity	259
§4. Gaussian path integrals	260
4.1. Gaussian path integral for a free particle	261
4.2. Gaussian path integral for the harmonic oscillator	264
§5. Regularized determinants of differential operators	268
5.1. Dirichlet boundary conditions	268
5.2. Periodic boundary conditions	274
5.3. First order differential operators	278

---

§6. Semi-classical asymptotics – II	280
6.1. Using the Feynman path integral	281
6.2. Rigorous derivation	282
§7. Notes and references	285
Chapter 6. Integration in Functional Spaces	289
§1. Gaussian measures	289
1.1. Finite-dimensional case	289
1.2. Infinite-dimensional case	291
§2. Wiener measure and Wiener integral	293
2.1. Definition of the Wiener measure	293
2.2. Conditional Wiener measure and Feynman-Kac formula	296
2.3. Relation between Wiener and Feynman integrals	299
§3. Gaussian Wiener integrals	301
3.1. Dirichlet boundary conditions	301
3.2. Periodic boundary conditions	302
§4. Notes and references	305
Chapter 7. Fermion Systems	307
§1. Canonical anticommutation relations	307
1.1. Motivation	307
1.2. Clifford algebras	311
§2. Grassmann algebras	314
2.1. Realization of canonical anticommutation relations	315
2.2. Differential forms	317
2.3. Berezin integral	319
§3. Graded linear algebra	324
3.1. Graded vector spaces and superalgebras	324
3.2. Examples of superalgebras	326
3.3. Supertrace and Berezinian	328
§4. Path integrals for anticommuting variables	330
4.1. Wick and matrix symbols	330
4.2. Path integral for the evolution operator	335
4.3. Gaussian path integrals over Grassmann variables	338
§5. Notes and references	340
Chapter 8. Supersymmetry	343
§1. Supermanifolds	343
§2. Equivariant cohomology and localization	345
2.1. Finite-dimensional case	345
2.2. Infinite-dimensional case	349

---

§3. Classical mechanics on supermanifolds	354
3.1. Functions with anticommuting values	354
3.2. Classical systems	356
§4. Supersymmetry	359
4.1. Total angular momentum	359
4.2. Supersymmetry transformation	360
4.3. Supersymmetric particle on a Riemannian manifold	362
§5. Quantum mechanics on supermanifolds	364
§6. Atiyah-Singer index formula	369
§7. Notes and references	370
Bibliography	373
Index	383
