Preface	ix
Chapter 1. Introduction	1
1.1. What is a differential equation?	1
1.2. What is a solution?	2
1.3. More on direction fields: Isoclines	16
Chapter 2. First-Order Equations	25
2.1. Linear equations	25
2.2. Separable equations	35
2.3. Applications: Time of death, time at depth, and ancient timekeeping	45
2.4. Existence and uniqueness theorems	65
2.5. Population and financial models	83
2.6. Qualitative solutions of autonomous equations	98
2.7. Change of variable	112
2.8. Exact equations	121
Chapter 3. Numerical Methods	139
3.1. Euler's method	139
3.2. Improving Euler's method: The Heun and Runge-Kutta Algorithms	151
3.3. Optical illusions and other applications	162
Chapter 4. Higher-Order Linear Homogeneous Equations	171
4.1. Introduction to second-order equations	171
4.2. Linear operators	192
4.3. Linear independence	209
4.4. Constant coefficient second-order equations	216
4.5. Repeated roots and reduction of order	228
4.6. Higher-order equations	240

4.7. Higher-order constant coefficient equations	245
4.8. Modeling with second-order equations	254
Chapter 5. Higher-Order Linear Nonhomogeneous Equations	265
5.1. Introduction to nonhomogeneous equations	265
5.2. Annihilating operators	275
5.3. Applications of nonhomogeneous equations	288
5.4. Electric circuits	303
Chapter 6. Laplace Transforms	319
6.1. Laplace transforms	319
6.2. The inverse Laplace transform	330
6.3. Solving initial value problems with Laplace transforms	335
6.4. Applications	350
6.5. Laplace transforms, simple systems, and Iwo Jima	357
6.6. Convolutions	363
6.7. The delta function	368
Chapter 7. Power Series Solutions	381
7.1. Motivation for the study of power series solutions	381
7.2. Review of power series	383
7.3. Series solutions	392
7.4. Nonpolynomial coefficients	408
7.5. Regular singular points	413
7.6. Bessel's equation	430
Chapter 8. Linear Systems I	443
8.1. Nelson at Trafalgar and phase portraits	443
8.2. Vectors, vector fields, and matrices	457
8.3. Eigenvalues and eigenvectors	472
8.4. Solving linear systems	482
8.5. Phase portraits via ray solutions	495
8.6. More on phase portraits: Saddle points and nodes	507
8.7. Complex and repeated eigenvalues	524
8.8. Applications: Compartment models	536
8.9. Classifying equilibrium points	549
Chapter 9. Linear Systems II	563
9.1. The matrix exponential, Part I	563
9.2. A return to the Existence and Uniqueness Theorem	580
9.3. The matrix exponential, Part II	584
9.4. Nonhomogeneous constant coefficient systems	595
9.5. Periodic forcing and the steady-state solution	608

Chapter 10. Nonlinear Systems	615
10.1. Introduction: Darwin's finches	615
10.2. Linear approximation: The major cases	627
10.3. Linear approximation: The borderline cases	647
10.4. More on interacting populations	653
10.5. Modeling the spread of disease	668
10.6. Hamiltonians, gradient systems, and Lyapunov functions	683
10.7. Pendulums	699
10.8. Cycles and limit cycles	708
Chapter 11. Partial Differential Equations and Fourier Series	717
11.1. Introduction: Three interesting partial differential equations	717
11.2. Boundary value problems	719
11.3. Partial differential equations: A first look	727
11.4. Advection and diffusion	734
11.5. Functions as vectors	745
11.6. Fourier series	760
11.7. The heat equation	777
11.8. The wave equation: Separation of variables	792
11.9. The wave equation: D'Alembert's method	804
11.10. Laplace's equation	812
Notes and Further Reading	833
Selected Answers to Exercises	837
Bibliography	863
Index	867
