Preface	ix
A remark on notation	xi
Acknowledgments	xii
Chapter 1. Expository Articles	1
§1.1. Quantum mechanics and Tomb Raider	1
§1.2. Compressed sensing and single-pixel cameras	10
§1.3. Soft analysis, hard analysis, and the finite convergence principle	17
§1.4. The Lebesgue differentiation theorem and the Szemerédi regularity lemma	30
§1.5. Ultrafilters, non-standard analysis, and epsilon management	38
§1.6. Dyadic models	57
§1.7. “Math doesn’t suck”, and the Chayes-McKellar-Winn theorem	69
§1.8. Nonfirstorderisability	79
§1.9. Amplification, arbitrage, and the tensor power trick	83
§1.10. The crossing number inequality	94
§1.11. Ratner’s theorems	103
§1.12. Unipotent elements of the Lorentz group, and conic sections	110
§1.13. The Jordan normal form and the Euclidean algorithm	118
§1.14. John’s blowup theorem for the non-linear wave equation	123
§1.15. Hilbert’s Nullstellensatz	130
§1.16. The Hahn-Banach theorem, Menger’s theorem, and Helly’s theorem	139

§1.17. Einstein's derivation of $E = mc^2$	146
Chapter 2. Lectures	155
§2.1. Simons Lecture Series: Structure and randomness	155
§2.2. Ostrowski Lecture: The uniform uncertainty principle and compressed sensing	180
§2.3. Milliman Lecture Series: Recent developments in arithmetic combinatorics	188
Chapter 3. Open Problems	211
§3.1. Best bounds for cap sets	211
§3.2. Non-commutative Freiman theorem	213
§3.3. Mahler's conjecture for convex bodies	216
§3.4. Why global regularity for Navier-Stokes is hard	220
§3.5. Scarring for the Bunimovich stadium	234
§3.6. Triangle and diamond densities in large dense graphs	239
§3.7. What is a quantum honeycomb?	243
§3.8. Boundedness of the trilinear Hilbert transform	249
§3.9. Effective Skolem-Mahler-Lech theorem	255
§3.10. The parity problem in sieve theory	259
§3.11. Deterministic RIP matrices	273
§3.12. The non-linear Carleson conjecture	278
Bibliography	283
