

Table of Contents for MEMO/257/1232

Dilations, Linear Matrix Inequalities, the Matrix Cube Problem and Beta Distributions

- Introduction
- Dilations and Free Spectrahedral Inclusions
- Lifting and Averaging
- A Simplified Form for ϑ
- ϑ is the Optimal Bound
- The Optimality Condition $\alpha = \beta$ in Terms of Beta Functions
- Rank versus Size for the Matrix Cube
- Free Spectrahedral Inclusion Generalities
- Reformulation of the Optimization Problem
- Simmons' Theorem for Half Integers
- Bounds on the Median and the Equipoint of the Beta Distribution
- Proof of Theorem 2.1
- Estimating $\vartheta(d)$ for Odd d .
- Dilations and Inclusions of Balls
- Probabilistic Theorems and Interpretations continued
- Bibliography
- Index
