Geodesics, Retracts, and the Norm-Preserving Extension Property in the Symmetrized Bidisc

- Introduction
- An overview
- Extremal problems in the symmetrized bidisc \mathbb{G}
- Complex geodesics in \mathbb{G}
- The retracts of \mathbb{G} and the bidisc \mathbb{D}^2
- Purely unbalanced and exceptional datums in \mathbb{G}
- A geometric classification of geodesics in \mathbb{G}
- Balanced geodesics in \mathbb{G}
- Geodesics and sets V with the norm-preserving extension property in \mathbb{G}
- Anomalous sets $\mathcal{R} \cup \mathcal{D}$ with the norm-preserving extension property in \mathbb{G}
- V and a circular region R in the plane
- Proof of the main theorem
- Sets in \mathbb{D}^2 with the symmetric extension property
- Applications to the theory of spectral sets
- Anomalous sets with the norm-preserving extension property in some other domains
- Appendix A. Some useful facts about the symmetrized bidisc
- Appendix B. Types of geodesic: a crib and some cartoons
- Bibliography
- Index
