Introduction	1
I.1. Local topological field theory	1
I.2. Three-dimensional topology and three-dimensional algebra	2
I.2.1. From algebra to topology	2
I.2.2. From topology to algebra	3
I.3. Results	4
I.3.1. On 3-dualizability	4
I.3.2. On categorified 2-dimensional field theories	5
I.3.3. On quadruple duals	6
I.3.4. On tensor and bimodule categories	7
I.4. Outlook	9
I.5. Overview	10
Chapter 1. The algebra of 3-framed bordisms	13
1.1. n -framed manifolds and n -framed bordisms	14
1.1.1. n -framings from normally framed immersions	14
1.1.2. n -framings with boundary and corners	15
1.1.3. Low-dimensional examples of n -framed bordisms	16
1.2. Duality in the 2-framed bordism category	17
1.3. The Serre bordism and the Serre automorphism	19
1.4. The Radford bordism and the Radford equivalence	21
1.4.1. A decomposition of the Radford bordism	21
1.4.2. A categorical formula for the Radford equivalence	22
Chapter 2. Tensor categories	27
2.1. Conventions for duality	28
2.2. Tensor categories, bimodule categories, and the Deligne tensor product	30
2.2.1. Linear categories, finite categories, monoidal categories, rigid cats	30
2.2.2. Module categories, functors, and transformations	31
2.2.3. Balanced tensor products and the 3-category of finite tensor cats	33
2.3. Exact module categories	35
2.3.1. Properties of exact module categories over finite tensor categories	35
2.3.2. The tensor product of exact module categories is exact	36
2.4. Dual and functor bimodule categories	38
2.4.1. Flips and twists of bimodule categories	39
2.4.2. Duals of bimodule categories	40
2.4.3. The dual bimodule category is the functor dual	41
2.4.4. The relative Deligne tensor product as a functor category	42

2.4.5. Dual bimodule categories as modules over a double dual	44
2.5. Separable module categories and separable tensor categories	44
2.5.1. Separability and semisimplicity	45
2.5.2. Separable bimodules compose	46
2.6. Separability and global dimension	49
2.6.1. Global dimension via quantum trace	50
2.6.2. The algebra of enriched endomorphisms of the unit	52
2.6.3. Fusion categories are modules over a Frobenius algebra	53
2.6.4. The window element of the representing Frobenius algebra	54
Chapter 3. Dualizability	57
3.1. Duals of tensor categories and invariants of 1-framed bordisms	58
3.1.1. The dual tensor category is the monoidal opposite	58
3.1.2. The twice categorified 1-dim field theory associated to a tensor cat	60
3.2. Adjoints of bimodule categories and invariants of 2-framed bordisms	62
3.2.1. The adjoint bimodule category is the functor dual	62
3.2.2. The categorified 2-dim field theory associated to a finite tensor cat	63
3.3. The Radford adjoints and the quadruple dual	66
3.3.1. Finite tensor categories are Radford objects	67
3.3.2. A topological proof of the quadruple dual theorem	68
3.3.3. A computation of the Radford equivalence	69
3.4. Adjoints of bimodule functors: separable tensor cats are dualizable	72
3.5. Spherical structures and structured field theories	74
3.5.1. Pivotal structures and trivializations of the Serre automorphism	75
3.5.2. Spherical structures as square roots of the Radford equivalence	76
3.5.3. Semisimple sphericity as a trace condition	77
3.5.4. Oriented, combed, and spin field theory descent conjectures	78
Appendix A. The cobordism hypothesis	81
Bibliography	85
